# SCOTTISH MACYIVEN

ESTABLISHED

# INSTITUTION.

incorpoi 184:

Head Office: 6, ST. ANDREW SQUARE, EDINBURGH.

ance offers to Members the advantage of with prorates which differ but little from the non-profit usually charged.

The whole Surplus goes to the Policyholders on a system at once safe and equitable—no share being given to those by whose early death there is a loss to the Common Fund.

## Endowment Assurance.

SPECIAL CLASS WITH SEPARATE FUND.

Policy-holders in this Class share exclusively in the whole Surrethereof, and Bonuses are allotted on the compound systematics.

### Annuities.

RATES MAY BE HAD ON APPLICATION.

FUNDS EXCEED: £16,250,000.

Branch Offices in Glasgow, Abesdeen, Dandee, Birmingham, Brissal, Cardiff, Le Liverpeol, Manchester, Newcastle, Nottingham, Belfast, and Dublin.

LONDON: 3, LOMBARD STREET, E.C. 3; WEST END: 17, PALL MALL, S.W.

The block at side has figured in this well-known subjecting for all consecutive years, and must be will known for the public at home and abroad in connection with the lest grades of British woollens Prices for the moment are fluctuating because of the disequantiation of trade interpart of the disequantiation of trade interpart of the consecutive can be no permanent allegizing white wages and other expenses of analysische remain; atationary. This business has been developed from small beginnings without any ambitious views of extension; it remains, as always, a personal one, the principal desiring no more tade than he can adequately and faithfully deal with, and his customers be lenefied. It must not be forgotten that while there is scarcely any limit to the production of inferior qualities of goods meant for the multitude, there certainly is for the better, interesting only to the select and distribunianting few whom we alone cater for, and who have the facult to appreciate the difference between real cheapmens and the counterfeit. W. E.

THE SECONDHAND OPTICAL STORES.

NOTE.—WHITAKER'S ALMANACK was first published in 1868 (for the year 1869). and since 1887 there have been two editions. For 1921 the Popular Edition (in paper cover with Zodiac design) consists of 578 pages, and is sold for 3s. net.; the Half-Bound Edition (in red and green cloth cover) consists of 970 pages, and is sold for 7s. 6d. net.

## PREFACE TO THE LITED ANNUAL VOLUME.

WHITAKER'S ALMANACK for 1921 is printed on paper of pre-War quality, and the 1914 price of £18 per ton for the paper having risen to £88 per ton, a small (but not proportionate) increase has been made in the price of the book. This increase has been set off by the addition of a number of articles, as may be seen from the size of the present volume.

The principal additions, in the order of their appearance, are extensions of the Index, a key to the Surnames of Peers and to Courtesy Titles, a list of Companions of the various Orders of Knighthood, a table of Administrations from 1804–1920, an extension of the lists of Societies and Institutions, additions to the Legal Notes and to the tables of Intestates' Estates (with particular reference to Scots law), further entries in the tables of Sporting Records, short Historical Sketches of England, Wales, Scotland and Ireland, accounts of the principal Cities of Great Britain, and additions to the Places of Interest in and around London.

In the Geographical Section the development of Self-Government in India is dealt with, and new articles are provided for Egypt and the Sudan, Cameroon, Kenya, Mesopotanna, Palestine and Haifa, Tanganyika, Togoland, Amnenia, Austria, Danzig, the German States, Kurdistan, Russia and the various Russian States, and Syria, Cilicia and Lebanon.

Questions of the Day, introduced in the 1920 edition, are again the subject of paragraph articles, and the annual summaries of Science and Invention, the Drama. Music and Meteorology, are again presented, together with an illustrated guide to Hall Marks on Plate, and other articles of general interest.

The British Empire Industries section has again been included, and supplies nuscellaneous information concerning various commodities produced or manufactured under the British flag.

Correspondents in all parts of the globe have assisted the Editor in preparing the book for the press, and while again thanking them for their friendly co-operation, the Editor begs to request that letters may be posted in such time as to reach the address stated below not later than the last day of October.

#### DURATION OF LIGHT AND DARKNESS.

THE second column of the first page of Calendar for every mouth contains a small diagram showing the smaunt of Darkness, or of Sun or Moonlight. These small figures represent the twelve hours from 6 P.M. to 6 A.M., and have four divisions, each representing three hours. From Jan. 25. 1921, there is moonlight from 6 P.M. till 6 A.M. (approximately), but from the 4th to the 2th there is no moonlight. In the summer months the Sun comes to our aid.

THE DIAGRAMS USED ARE-

Six to 9 | 6 to 22 | 6 to 3 | 6 to 6: | Nine to 22 | 9 to 6: | Twelve to 3 | 22 to 6: | Three to 6

THE SUN AND PLANETS.

ANGULAR SEMIDIAMETER. HORIZONTAL PARALLAX. 2 ç 0 ð 0 6's 9's 4'6 1'8 1'0 16 18 2'3 8'8 

ECLIPSES, CONJUNCTIONS, AND OTHER CELESTIAL PHENOMENA.

January z. Day breaks at 6h. am. Civil twilight ends, z6h. zam Night begins, z8h. zm. The length of the day from Sunrise to Sunset is 7h. sim.

The ending of Civil twilight is here defined as the time when the Sun's centre is 71° below the horizon. Night begins and Day breaks when it is 18 below.

Jan. z, 4h. Earth at least distance from the Sun, 9z,34z,000 miles. Periheliou.

Jan. 3-4. Echpse of Jupiter's satellite IV. See p 80. Jan. 4. Jupiter at a stationary

point. Jan. g. Mean time taken by

Sun's semidiameter in crossing the meridian, 1m. 10'6s.

Jan. s. Saturn at a stationary point.

Mars in conjunction Jan. with Venus, 14h 38m. Qoo 25' S. Jan. 13 Mars in conjunction Jan. 13 with ), 9h. 38m. 65° 23' S

Jan. 22. Venus in conjunction

with D, 12h. 33m. \$\sigma 5' 32' S. with D, 12h. 33m. \text{Mercury} superior conjunction.

Jan. 27. Jupiter in conjunction with ), in 53m. 2 5°3' N.
Jan. 27. Saturn in conjunction Jan. 27.

with ), rsh sim. h 5 34' N Jan. 31, morn. Occultation of 8 Libra and a Libra. See p. 8r.

Uranus sets, Jan z, soh. 43m Neptune rises Jan. 1, 18h. 45m Jan. 31, 16h 43m.

In this month the Mornings increase agm., the Afternoons 46m Constellations near the South meridian at sah.: Perseus, Taurus Eridanus, Auriga, Orion, Gemini, Canis Minor, Canis Major.

The 24-hour Clock .- In this issue of WHITAKER'S ALMANACE the hours of the day are numbered from o to ag, the hour after midnight being o, and the abbrevia-tions A.M. and P.M. are not now used. This "twenty-four hour" method has been in use in some other countries for some years, and was adopted by the British Services during the war. In 1929 the Home Secretary appointed a Committee to consider and report as to the advisability of adopting this method in the United Kingdom for official and other public purposes, and as the Committee decided to recommend the scheme, there appears to be sufficient reason for making this important change in this Almanack. The

MERCURY rises shortly before the Sun at the beginning of the month. At the end it will be an evening star setting less than an hour after the bun in the W.S W.

Q VENUS will be seen in the south-west in the early evening. It moves from the constellation Capricornus, through Aquarius into Pisces Its brightness increases to magnitude — 4.0.

d MARS is an evening star near venus, higher in the first part of the month but lower and to the

right at the end

, h JUPITER and SATURN rise in the late evening north of East. Jupiter is in Leo, Saturn on the confines of Virgo, to the left of and lower than Jupiter. Magnitudes: Jupiter, - z 9, Saturn, + z.z. 1 to 11 in the afternoon and evening, the second hour after noon being APPARENT RIGHT ASCENSION AND now called 13, and that immediately before midnight 23.

The Lords Commissioners of the Admiratly have already given instructions that the hours of the day shall be numbered in accordance with this method in the "Nautical Almanac," beginning with the large for the record of the control of the co

saue for the year ross. Until that date the astronomical day, which begins at noon, will be used as hitherto, and for that reason the system of the column "Mean Time at ob. Sidereal Time" in the second page of each month is not altered, but the hours are counted from a form, beginning at noon.

Feb. 25 Mean time taken by Sun's semidiameter in crossing the meridian, 1m 5'5

In this month the Mornings in crease 50m , , the Afternoons 49m Neptune uses Feb 1, 16h 39m sets 7h 51m morn. Feb. 28, 6h 3m

The Zodiacal light may be seen at the end of this month, as the moon will then be absent in the evening.

Constellations near the S. meridian at sah . Aunga, Tamus, Oriou, Gemini, Canis Minor, Monoceros, Canis Major, Argo, Cancer. Hydra.

Note. - The arrangement of the Table of Moonrising, southing, and setting on this page is as in last year's issue of this Almanack. The times in the second column are those of Moonrise on the day of the month shown by the adjacent figure in the first column, the hours being expressed according to the method described in the note on p. s6. The figures in the third and fourth columns show the time of the southing and of the setting which next follow that rising, and these sometimes happen

<sup>•</sup> The days thus indicated throughout the Almanack are those on which High Thies may be expected. Strong northerly winds in the North Sea and a low barometer with heavy rains in the counties drained by the Thames will probably cause a higher rase of the river, and the low lying riverside distincts to be flooded

### MORNING AND EVENING STARS

O MERCURY is an evening star throughout February in the constellation Aquarius, and in the middle of the month may be seen by the naked eye about 6 o'clock low down south of west

VENUS is also an evening star and remains in the constellation Pisces. This planet is a bright object in the south west sky in the twilight and sets north of west Magnitude, -4 o to -4 s.

d Mars is also in the constellation Pisces, below and to the right of Venue. It sets earlier, nearly

due west. Magnitude, + 1 5.

A by Jupiters and Saturn rise during the early evening. Both are moving from left to right in the constellation Leo and are in line with the star Regulus, Jupiter, much the brightest of the three objects, being in the middle. Magnitude. Jupiter, -2'o; Saturn, + 2'o

after midnight of the day indicated. In such cases the figures are APPARENT RIGHT ASCENSION AND in heavy type. It is therefore to be remembered, in using this Table, that these distinctive figures always indicate a time on the morrow of the day of its line. To one day in each lunation there are necessarily no entries, but there are no omissions. On the lines immediately following that with no entry the times given for moonrise are in the early morning of the day to which they are assigned. A similar system is followed in the Tables of Rising, Southing, and Setting of the Planets on this and other pages.

### MORNING AND EVENING STARS.

MORNING AND EVENING STARS.

MRECURY is a morning star, but rises not long before the Sun.

VERUS is a bright evening star at the beginning of the month, becomes fainter and sets earlier, and being at Inferior conjunction on the sand, it rises and sets before the Sun in the last week of April. It moves in retrograde direction from the constellation Aries into Pisces.

MARS lingers in the evening sky. It moves eastward somewhat rapidly, passing from the constellation Aries into Taurus, and sets in the W.N.W. a few minutes before ark.

", b. JUPTER and SATURN are to be seen in the evening twilight in the south-east sky. They are in the west at altitude 15° about 3 o'clock in the morning early in the month. Both are moving westward in the constellation I.eo. Magnitudes: Jupiter, -ze to -z\$; Saturn, +o 9 to +z c.

1	occasion was on July 26, 1907. The plane similarly passed through the Earth on 1920 November 7, 1921 February 22, and will again on 1921 August 2. Between the first two dates the south side was illuminated by the Sun, and the Earth was on the north side. Between February 22 and April 10 the Sun and Earth are on the south side. From April 22 to August 3, the north side will be illuminated, but the Earth will be on the south side. In the intervals when the Sun and Earth are on opposite sides of the plane the Eing system is	b. 8	
1	Sun and Earth are on opposite sides of the plane the Ring system is said to be invisible, but has been found not to be entirely so.	10 18

ANGULAR SEMIDIAMETER.

ECLIPSES, CONJUNCTIONS, AND OTHER CELESTIAL PHENOMENA. May z. Day breaks at zh. 4m. Civil twilight ends at zoh. zzm. Night begins 21h 50m. length of the Day 1-14h. 45m.

May 5. Mean time taken by Sun's semidiameter in crossing the meridian, zh. 6'zm.

May 6. Venus in conjunction, with D, 4h. 45m. Q 2°55' N May 6. Jupiter at a stationary point.

May 7. Mercury in conjunction with D, 13h. 59m. \$ 100' N.

May 8. Mars in conjunction with ), 22h. 4m & 3° 27' N

May 10. Mercury in Superior conjunction, 11h

May zz. Venus at a stationary point

May 15. Jupiter in conjunction with D, ash. 58m. 25° 28' N

May 16. Saturn in conjunction with D, 13h. 48m. 12 5° 52' N.

May 27-28. Jupiter's Satellite, IV. in eclipse. See p. 80

May so Mercury in conjunction with Mars, 3h. sam. C x 3' N.

May 20, aft Occultation of  $\nu$  Librae. See p. 81.

May 21, 17h. Saturn at a stationary point

May 25. Mean time taken by Sun's semidiameter in crossing the meridian, zm. 7 78.

May 28. Venus at greatest brilliancy.

The disc of Venus is crescent during the month; appearing like the moon after third quarter.

Neptune sets May r. zh. 58m. May 31, 23h. 57m.

In this month the Mornings increase 43m.; the Afternoons 44III.

Constellations near the S. meridian at sah : Leo, Leo Minor, Crater, Hydra, Corvus, Virgo, Boëtes, Libra

Venue at Greatest Brilliancy .-Venus will be very bright in the early morning at the end of May as she was in the evenings in March. Similar epochs of great brilliancy occurred in August and construction of the year range. This region is a construction of the year range. This region is a construction of the year range. MORNING AND EVENING STARS.

MERCURY rises nearly with the Sun in the first week of May, and is an evening star after superior conjunction on the roth. It may be seen by naked eye in the last week of the month, about anh. above the north-west horizon.

Q VENUS is a morning star rising an hour or more before the Sun, N. of E. It will be at greatest

briliancy on the a8th, when its magnitude will be - 4'z.

d Mars is still above the horizon for a short time after sunset, setting N.W. by W. It passes

between Aldebaran and the Pleiades about the roth.

4, h Jupiter and Saturn are in the western sky in the late evening, and set before sunrise. They change position little during the month, Jupiter being nearly midway between Saturn and Regulus.

by several million miles, but will be practically invisible, since in
her unilluminated hemisphere will be presented to us. In
March and May though only a part of the illuminated surface is
to be seen (like the crescent Moon), since the planet is near, the
largeness and brightness of the disc compensate for the small
fraction of it seen illuminated. Hence the appearance noted.
Venus may sometimes be seen even when near inferior con-
junction if she is higher in the sky than the Sun, as she was
on April es

Mean Longitude of Moon's Ascending Node, June 2, 2040 58' Q.

Eccipses, Conjunctions, and other Celestial Phenomena

June t. Civil twilight ends at sat. 6m. There is no closed night in this month in the latitude of London. The length of the Day from Sunrise to Sunset on June z, is 25h. zam. Its length is nearly 156h. zam. from June ze to ze.

June 3. Venus in conjunction with ), 3h. 4m. Q r° 36'S.

June 5. Mean time taken by Sun's semidiameter in crossing the

meridian, 1m. 84s.

June 6. Mars in conjunction

with ), 16h 57m. of 4° 54′ N.

June 8. Mercury in conjunction with ), oh. 43m. of °37′ N.

June 11, morn. Mercury at greatest elongation, 24° 13′ E.

June 12. Jupiter in conjunction with ), 6h. 28m. 15° g'N.

June 12. Saturn in conjunction

with ), 19h 47m. h 5° 35' N.

June ax. Sun enters the sign Cancer (Summer Solstice), 23h 36m.

June 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 8 7s.

June 29. Mars in conjunction. Uranus rises June 1, oh. 51m.; June 20, 22h. 53m.

Neptune sets June 1, 23k. 53m.
The disc of Venus is crescent during the month, increasing to nearly half full at the end.

In this month the Mornings increase 51/2m. up to the 18th, and then decrease 4m. The Afternoous increase 11/2m up to the 26th, and then decrease slightly.

Constellations near the S. meridian at midnight Corona, Hercules, Ophiuchus, Serpens, Scorpius, Lyra, Aquila, Sagittarius.

The Longest Day. — Though there is but slight difference in the length of the interval between sunrise and sunset on the days about June sr, there is in general one of these days which is a few seconds longer than any other. This is the day on which the Summer Solstice is alia, and a the end of a century is June so or sr, whilst at the beginning it is a day later, and June sr or as is the longest day. The reason for this difference in date may be briefly stated. Because the Tropical year is not an integral number of days, the solstice falls later in the calendar year by year by six hours, nearly. It is not permitted to be very late because the intercalation of the extra day in leap year brings it back one whole day. This whole day is too much, because the solatice is later yearly by not be proposed.

## MORNING AND EVENING STARS.

- MERCURY is an evening star, and may be seen in the twilight in the first half of the month, low down in the N.W. by W.
  - Q VENUS is a morning star, rising two hours or less after midnight E.N.E. Mag., -4 2 to -4 c. of MARS, in conjunction on the asth, rises and sets nearly with the Sun
- 4, 5 JUPITER and SATURN are in the western sky during the evening and set soon after midnight, or earlier at the end of the month. Both are moving from right to left, Jupiter rather the faster, so that it is approaching Saturn. Magnitudes in the middle of the month; Jupiter,  $-x_5$ ; Saturn,  $+x_5$ .

whole, it falls earlier in the calendar as the century progresses, and the dates of the longest day at the beginning and end are as stated. In this year it happens that the solstice occurs only at minutes before midnight of June 21, and the difference in length of the two days is scarcely appreciable. This acceleration of the date during the century is corrected by the omission of the intercalary day in the centennial year, which puts the date a day later. But this does more than is necessary, and a further compensation is made by making the fourth centennial year a leap year.

Meteors of the Perseid stream begin to appear in July.

In this month the Mornings decrease 34m., and the Afternoons

291n. Constellations near the S. meridian at midnight: Hercules, Ophiuchus, Serpens, Lyra, Cygnus, Aquila, Delphinus, Equileus, Aquarius, Capricornus, Sagittarius.

Occultation of Venus.—In her monthly journey round the sky, the Moon necessarily passes in front of and occults the more distant stars. The phenomenon is less frequent than might be at first thought expected, speaking of the bright stars, and it is still rarer in the case of the planets. In the early morning of July a, about 10 minutes after sunrise, Venus being nearly due E., at an altitude of about 25°, will be occulted by the Moon then in its last quarter. The disappearance will take place at the illuminated edge of the Moon, the re-appearance at the unilluminated, and

MORNING AND EVENING STARS.

MERCURY sets before the Sun during the greater part of the month. It rises with the Sun on the

A MERCURY Sets Defore the sun during the greater part of the month. It lies with the Sun of the rath, and is a morning star after that date rising about N.E. by E..

VENUS is a morning star, and rises unusually early. It is in the constellation Taurus, and will pass between Aldebaran and the Pleiades about the roth. Magnitude. —4 to to —3 ?.

MRR., which is passing through the constellation Gemin, begins to be a morning star. It rises an hour before the Sun at the end of the month N.E. by E.

Ly JUPITER and SATURN are in the western sky for a short time after sunset. The two planets are partly due wast at altitude about —0 at all in the middle of the month. Magnitudes Turiton.

are nearly due west at altitude about roo at axh. in the middle of the month. Magnitudes Jupiter, - 1'4; Saturn, + 1'4.

the first may be seen by naked eye, but the reappearance happens an hour after sunrise. Stars when occulted disappear and reappear instantaneously, because they have no appreciable disc, being so far from us; but Veius will occupy 30 or 40 seconds in the process, and the disappearance and reappearance of the two edges will be seen as distinct phenomena in a telescope. The last occasion of an occultation of Venus was 1808, May 28, when the reappearance occurred so minutes before sunset, and the planet, easily visible to the cracett Moon.

### MORNING AND EVENING STARS

OMERCURY is a morning star, rising more than an hour before sunrise in the first week of the month. It rises and sets nearly with the Sun at the end.

ONE VENUS continues to be a morning star, as it will be until Superior conjunction in 1922 February. It passes through the constellation Gemini into Cancer during August. Magnitude, -3.7 to -3.5.

MARS, in the constellation Cancer, is also a morning star, rising in the dawn with Mercury at the beginning of the month On the morning of the 11th the two planets rise close together in the N.E. by E., Mars being the higher.

1, 1, JUPITER and SATURN are still above the horizou for an hour after sunset and set north of it. Both planets are moving from right to left, Jupiter considerably the faster.

-----

shooting stars are believed to be quite small bodies which pulverise, the remnants finding their way through the atmosphere to earth. Occasionally bodies of larger size meet our atmosphere which may burst or break up, and the fragments come to earth as meteorites. Shooting stars congregate in swarms, the individual members of which describe similar orbits, and as they pass through our atmosphere appear to radiate from some one point of the sky by an effect of perspective, and so form a meteor shower. The Perseid Meteor Shower, which begins in July or possibly in June, and has its maximum in August, is the most interesting and attractive of the veet.

attractive of the year.

sets Sept. 30, 3h. 14m. In this month the mornings decrease 47m., and the Afternoons zh. 6m

Constellations near the S. meridian at sah.: Lyra, Cygnus. Aquila, Delphinus, Aquarius, Cap-ricornus, Equuleus, Pegasus, Pisces.

The Harvest Moon.-It will be seen that the interval between successive entries in the column of Moonrise is only about 23 minutes near Full Moon in this month (Sept. 15-18), which is a less in-terval than in other parts of the column. This Full Moon is called the Harvest Moon.

The orbital motion of the Moon causes her to move among the stars rather rapidly from West to East, and she comes to the meridian of any place, or is due South, about so minutes later night by night. For this reason alone she would rise later night by night by this amount, but the time of rising (except at places on the Equator) is affected by her distance north or south of the celestial equator. In North latitude she rises earlier, with increased north Dec. There is a certain period in each lunation when the Moon is moving northward rather rapidly, and this causes an acceleration which modifies the so minutes' retardation in th

### MORNING AND EVENING STARS.

MERCURY will be above the horizon for a short time after sunset during the month. Conjunctions

MERCURY will be above the horizon for a short time after sunset during the month. Conjunctions of this planet with Jupiter and Saturn are noted on the opposite page.

Y VENUS passes from Cancer into Leo, being near the star Regulus in the morning of the z5th. It will be seen due East between 4 and 5 o'clock in the morning, Magnitude, - 3'z to - 3'4.

MARS is also a morning star, not far from Venus and near Regulus on the z7th.

Y JUPITER and SATURE are in conjunction—that is, they are nearly in line with the Earth on the z4th, when the two planets will be separated in the sky by twice the breadth of the Moon. Being near conjunction with the Sun the planets set soon after sunset, and the near approach is not likely to be generally noticed. (See p. 64) likely to be generally noticed. (See p. 66)

rise nearly at the same time for several nights in succession at this epoch of northward movement. This happens in every lunation, and in general passes unnoticed; but in the September lunation it happens when the Moon is full, and then the Moon, full or nearly so, rises about sunset on two or three consecutive nights. so, rises about subset on two or three consecutive nights. It is phenomenon is known as the Harvest Moon. The precise details vary in different years according to circumstances, and in some years the retardation on successive nights may be much less than seminutes. Also, for certain reasons, two Full Moons may have hat claims frompare August se), but the term is always applied to be Full Moon nearest to the Autumnal Equinox. See note, p. 90.

MORNING AND EVENING STARS.

WERCURY is above the horizon for a short period after sunset at the beginning of the month. It

Afficial is above the form for a short period actor states at the beginning of the adouth. It approaches the Sun and is at Inferior conjunction on the 33st of 3 % %. The four planets VENUS, MARS, JUPITER and SATURN are all Morning stars in the last three months of this year, and move almost wholly in the constellations Leo and Virgo. At a c'clock in the morning in the middle of October the four planets will lie in a nearly vertical line slightly South of East. Jupiter and Saturn will be near the horizon in Virgo, Mars will be at an attitude of account on the 18th Venus will be nearly midway between Mars and the two planets first named. Venus moves towards Jupiter and Saturn and will be close to Saturn on the 23nd and to Jupiter on the auth, so that between these dates Venus will be hetween the other two planets all being within account. agth, so that between these dates Venus will lie between the other two planets, all being within zeo of the horizon at 5 o'clock with Mars about  $x^0$  higher. This close congregation of the planets is noteworthy. Mars is of second magnitude; Saturn  $+ x \cdot z$ ; Jupiter  $- x \cdot z$ , or nearly equal to Siring.

as separate stars. Six are easily counted, and it is said that some persons have been able to see twelve or even fourteen separately. Photographs with large telescopes show that each of the brighter stars is surrounded by nebulosity with extensions which join a star to its neighbours. Because of this nebulosity, and because the large stars have almost identical proper motion, it is believed that these stars form an actual dister in space, and that they are not seen as a group in the sky, merely because they are in the same line of vision.

APPARENT RIGHT ASCENSION and Declination of Polaris.

Mean Longitue				26 24					

Eclipses, Conjunctions, and other Celestial Phenomena.

1921.

November 1. Day breaks at 1,0m Civil twilight ends at 17h. 20m Night begins, 18h. 28m. The length of the Day is 9h. 38m.

Nov. 5 Mean time taken by Sun's semidiameter in crossing the meridian, 270. 7'15.

Nov. 9. Uranus in conjunction with ), 13h. 47m. H 4° 30' S.

Nov. 14, 1h. 48m. Mars and Saturn in conjunction. 6 ° 53'S

Nov. 16. Mercury at greatest

elongation, 19° 26' W.

Nov. 18, morn. Eclipse of Jupiter's Satellite IV. See p. 80.

piter's Satellite IV. See p. 80.

Nov. 25. Saturn in conjunction with D, 2h. 49m. h 3°25' N.

Nov 25 Mars in conjunction with ), 12h. 43 m. & 1° 56' N.

Nov. 25. Jupiter in conjunction with  $\mathcal{D}$ , 13h. 46m.  $\mathcal{U}$  1° 43' N.

Nov. 25. Mean time taken by Sun's semidiameter in crossing the meridian, 1m. 9'48.

Nov. 26, 23h. 15m. Mars and Jupiter in conjunction. do'ro'N.

Nov. 28. Venus in conjunction with ), 2h. 24m. Q 1°25'S

Nov. 28. Mercury in conjunction with  $\mathfrak{D}$ , 5h. 56m.  $\mathfrak{D}$   $\mathfrak{r}^{\circ}$  2x' S.

Uranus sets Nov. 1, 1h. 5m.; Nov. 30, 23h. 7m

Neptune rises Nov. z, z3h. zm ; Nov. 30, zzh. 7m

In this month the Mornings decrease 49m., and the Afternoons 38m.

Constellations near the S. meridian at sak.: Pegasus, Pisces, Cetus, Andromeda, Aries, Perseus, Taurus

Planetary Conjunctions. — The planets Jupiter and Saturn, which have been drawing together in the last few years, are this year at their nearest, and on September 14 these two planets were to be seen in the sky separated by only a degree. This resulted from the fact that Jupiter and Saturn were from Heliocentric conjunction or had been brought by their orbital motion into line with the Sun on August as last. This happenshout every twenty years. The last heliocentric conjunction occurred in September 1907, so that a close approach is only to be seen three or four times in a lifetime. Jupiter and Saturn have been joined by Mercury, Venus and Mars in turn, and at the beginning of November the four, Venus, Mars, Jupiter and Saturn, are included within a space of 180°.

## MORNING AND EVENING STARS.

MERCURY is a morning star rising about a hours before the Sun in the latter half of the mouth in the ENE It will then be quite close to Venus, to the left and below.

VENUS has moved from Jupiter and Saturn (see last month) and rises later than those planets

It will be near Spica on the 7th, and passes from Virgo into Libra on the 18th. Mag., - 3'4.

of, U, b Mars, Jupiter, and Saturn are moving at different rates in Virgo Mars overtakes Saturn on the 14th, Jupiter on the 25th, and towards the end of the month at 5 o'clock these three planets will be near together at an altitude of about 20 south of east. Since Neptune is now in the south in the early morning, there are six planets above the horizon in the hour before sunrise. Magnitudes: Mars, + 19; Jupiter, - 13; Saturn, + 12.

between their extremes There was a similar congregation in November, 1901, and others even closer are on record, but they are between their extremes rare. There is no record that Jupiter and Saturn have made such close conjunction that they have been superposed, which has

happened in the case of other pairs of planets.

As to position in their orbits the six planets that are above the horizon at dawn are all on the same side of the Sun. On Nov. 23, ave will be included within an angle of 32° with the Sun as apex; whilst Neptune will be only so distant. In December, rose, some popular interest, amounting almost to alarm, which was quite without reason, was caused by a similar configuration.

APPARENT RIGHT ASCENSION AND DECLINATION OF POLARIS.

ECLIPSES, CONJUNCTIONS, AND OTHER CELESTIAL PHENOMENA.

December z. Day breaks at 5h. 4xm. Civil twilight ends 16h. 45m. Night begins 17h. 5ym.
The length of the Day is 8h. 8m.
From Dec. 18 to 25 the length of the Day is about 7h. 46m.

Dec. 5. Mean time taken by Sun's semidiameter in crossing the meridian, r.m. 10:38.

Dec. 6. Uranus in conjunction with ), 22h. 15m. 14 4° 16' S.

Dec. 22. Sun enters the sign Capricornus, 9h. 8m. (Winter Solstice.)

Dec. az. Saturn in conjunction with ), zzh. zom. h 3°8' N.

Dec. 23. Jupiter in conjunction with ), sh. om. 1/2 r° xz' N.

Dec. 23. Mars in conjunction with ), 22h. 59m. of o' 8' N.

Dec 25. Mean time taken by Sun's semi-diameter in crossing the meridian, 1m. 12'05.

Dec. 27, 16h Mercury in superior conjunction.

Dec 28. Venus in conjunction with ), 7h. 58m. Q 4° 38' S.

Dec. 29. Mercury in conjunction with ), 8h. 35m. \$\overline{\rho}\$ 6° 45' S.

Uranus sets Dec. x, 23h. 3m., Dec 3x, 2xh. 9m.

Neptune rises Dec. 1, 21h. 3m., Dec 31, 19h. 3m.

In this month the Mornings decrease s<sub>3</sub>m, the decrease continuing throughout the month The Afternoons decrease 4m. up to the 13th, and then increase 9m

Constellations near the S. meridian at 22h Andromeda, Trangulum, Aries, Cetus, Perseus, Taurus, Eridanus, Auriga, Orion.

The Shortest Day — For reasons similar to those given with reference to the Longost Day in the note on p. 46, the date of the shortest day, which is that on which the Winter Solstice falls, wares from year to year, and during the century. At the present time December as is always the shortest day, but as the solstice, on the whole, happens earlier as the years go on, in the latter half of this century the date will be Dec. as or as, as it was before the year agoo. Since the year agoos. Since the year agoos will be a leap-year; the date at the beguning of next century will containe to be Dec.

### MORNING AND EVENING STARS.

MERCURY continues to be a morning star, rising S.E. by E. an hour before the Sun at the beginning of the month. Being at Superior conjunction on the 27th, it rises and sets nearly with the Sun at the end.

? VENUS is still a morning star, but rises in the dawn This planet will move from the constellation Libra into Scorpius during December and is near the star Antares on the 14th. Magnitude, - 3.4 by d, ll, h Mars has moved from, and is now seen below. JUPITER and SATURN, and the distance between these two has increased. The three planets still form a line approximately vertical, JUPITER being midway between the other two in the middle of the month at an altitude of so at 4 o clock. Spica will

be seen to the right of Mars. Magnitudes: Mars, + x 8 to + x 5; Jupiter, - x 4 to - x 6; Saturn, + x 2. Though Dec. as is the shortest day from sunrise to sunset in his latitude, the Sun sets at its earliest by the Mean-time clock or so days sconer. This is to be accounted for by the Equation f Time, which is subtractive from Apparent time at this period of he year, and is decreasing in amount at the rate of half a minute er day. Apparent noon; and therefore sunset, is later daily on his account by half a minute. The effect of the change of the

an's declination which, up to Dec. ss, makes the time of sunset arlier, is less than half a minute per day after Doc. 13; and therere from this date the time of sunset, on the whole, grows later.

APPARENT RIGHT ASCENSION AND DECLINATION OF POLARIS.

## 76 Tables for Finding the Times of Junrise and Junset.

THIS double entry table provides the means for finding, with sufficient accuracy for practical purposes, the times of surrise and sunset at any place situated between latitude to N. and 60°S.

To use the table: In the horizontal line with

To use the table: In the horizontal line with the Sun's declination in the first column, and under the required latitude in the heading, there will be found the local apparent time of sunset. Subtracting this from sal. will give the local apparent time of sunrise. To obtain from this the local means time, the quantity in the second column on the second page of each month (which is known as the Equation of Time) appropriate to the day in question must be added to or subtracted from these apparent times of sunrise and sunset, as shown in the heading.

To find the corresponding Greenwich means the sunset of the subtracted from these apparent times of sunrise and sunset, as shown in the heading.

To find the corresponding Greenwich mean time, the difference of longitude of the place from Greenwich must be added if the place be

West, subtracted if East

The table is arranged for northern latitudes but will serve equally well for places south o the Equator, if the declination North in the firs column be considered South, and vice serve.

If the times of sunrise or sunset are require for any declination or latitude falling between the arguments in the table, they may be foun-

by simple proportion.

#### THE TIME OF SUNSEL

The times of sunrise and sunset given in thi Almanack are the times when the centre of the Sun's disc is on the visible horizon at sea-level a Greenwich, computed on the assumption that the horizontal refraction is 34%. It is doubtfur whether there is a precise legal definition of sunrise and sunset. The above has generally bee adopted as a correct statement, though in som Tables the instant when the upper limb, or edge of the Sun is on the visible holizon is given a

The the time when the Sun rises and sets. the distinction between local sunset and the time when the sun sets at the place in questions sunset, rather than with a precise definition. It has been held by a legal tribunal,

as would be expected, that the word "sunset" legal question has been more concerned with in laws and regulations must be taken to mean the distinction between local sunset and the time when the sun sets at the place in ques-

## TO FIND THE GREENWICH TIME OF SUNRISE AT CERTAIN PLACES IN THE BRITISH ISLES IN EACH MONTH OF THE YEAR.

The Table gives the number of minutes to be added to or subtracted from the time of sunrise at Greenwich, to find the Greenwich time of surrise at the place named in the first column, on the first day of each month. The corrections to be applied on other dates and for other places in the neighbourhood of these may be inferred approximately by interpolation.

The sign + means that the time required is later than that at Greenwich. The sign -, that

t is earlier.

Comparison of these Tables with a map will show that the places at which the Sun rises or sets at the same moment on any day lie in a straight line across the map, the lines for different moments being parallel; and that the lines change their inclination to the meridian throughout the year

The corrections in Tables II and III. are always to be added; x' is to be subtracted from the final result because the quantities in Table III, above have been increased by that amount in order that they may all be additive.

## Bolar and Sibereal Time.

# TO CHANGE INTERVALS OF MEAN SOLAR TIME INTO THE EQUIVALENT INTERVALS OF SIDEREAL TIME AND VICE VERSA.

THE length of a Sidereal day is 23k. 26m. 4 cos. of Mean Time. One hour of Sidereal Time is, therefore, equivalent to 59m. 50 cys. of Mean Time, and one hour of mean solar time is equivalent to 1k. om. 9 26s. of Sidereal Time. This may be expressed otherwise by saying that the Mean Time clock loses or retards 9 3s. per hour on the sidereal clock, and that the sidereal clock gains or accelerates 9 3s. per hour on the Mean Time clock. These quantities—"acceleration" and "retardation"—are tabulated below for the argument (common to both) in the middle columns. If the argument be considered as Mean Time, its equivalent in Sidereal Time is obtained by adding the acceleration. On the other hand, if it is considered to be Sidereal Time, its equivalent in Mean Time is found by subtracting the retardation.

ECLIPSES IN 1921.

In the year 1921 there will be four Eclipses, two of the Sun and two of the Moon.

I. An Annular Eclipse of the Sun in the morning of April 8. An Annulus or ring of the Sun's bright disc will be seen round the eclipsing Moon from the northern part of Scotland, and from a small strip of the north-west coast of Norway, which includes the Lofoden Islands. The limiting line north of which an annular eclipse may be seen passes approximately from Arisaig in Invernesshire (2h. 52m.) on the west coast of Scotland to Dornoch Firth (2h. 52m.) on the east and thence to Norway, passing about 30 miles south of Tromso. The central line of Eclipse from which the Annulus will be seen symmetrically placed round the lunar disc passes a few miles south of Tarbert in the Isle of Harris (8h. 54m.), and near Cape Wrath (8h. 57m.) in

the extreme north-west of Scotland.

A Partial Eclipse will be seen from the remaining portion of the British Isles, from the whole of the Coutment of Europe, from Northern Africa, and a large part of Northern Asia, India and part of Chua being excluded. From places in the British Isles the portion of the Sun's disc that will be eclipsed will be large, a small segment only of the lower edge being left unobscured Details of the eclipse at various places

	Eclipse Begins	Greatest Phase	Eclipse Ends	Mag
s	н, м	H M.	ии	
Edinburgh	7 48	8 53	10 9	0'95
Armagh	7 38	8 48	10 3	0.02
Dublin		8 46	10 2	0'94
	7 41	8 51	10 9	0 93
Oxford	· ·7 35	8 47	10 4	o <b>8</b> 9
Cambridge	7 37	8 49	10 7	0.80
Greenwich	7 35	8 47	10 5	o 88

The last column shows the fraction of the Sun's diameter that will be eclipsed at Greatest

Phase.

II. A Total Eclipse of the Moon in the morning of April 22. Invisible at Greenwich. The beginning will be visible generally from North America, South America and the Atlantic and Pacific Oceans. The ending visible generally from North and South America, Australia, the Pacific Ocean and the Eastern portion of Asia. The Moon will enter the Earth's shadow at 3 minutes after 6 o'clock, and leave it at 26 minutes after 9 o'clock. Total Eclipse begins at 7h. 24m. and ends at 8h. 5m. (Greenwich Time). Magnitude of the Eclipse 2 074.

III. A Total Eclipse of the Sun on October r. Invisible at Greenwich. The path of Total Eclipse lies wholly in the Ocean South of South America, and crosses the meridian of Greenwich quite near to the South Pole. The only land from which totality may be seen is the South Shetland Islands and Graham Land. The Sun will be seen Partially Eclipse from South America as far North as latitude xo S. The Greatest duration of Total Phase on the central line will be xxs seconds, at about half-an-hour after Greenwich noon.

IV. A Partial (nearly Total) Eclipse of the Ioon on October 16. Visible at Greenwich. Moon on October 16. Moon on October 16. Visible at Greenwich. The beginning will be visible generally from Asia (except the eastern portion), Europe, Africa, the Eastern part of South America, the Indian Ocean and the Atlantic Ocean. The end will be visible from the same regions, excepting the eastern part of the Indian Ocean, with the greater part of North and South America added.

Moon enters Penumbra... Oct 16d. ach. 1m. Shadow ..... ,,

,, 21h. 14m. Middle of Eclipse ..... , , szh. 54m. Moon leaves Shadow .... Oct 17d. oh. 34m. Middle of Eclipse ..... Penumbra... ,, zh. 46m.

The point of the Moon's disc which is the first to enter the shadow is at 45° from the North Point towards the East. The point where it leaves the shadow is 77° from the North Point towards the West. At Greatest Eclipse the portion of the Moon not in the shadow will be at the lower edge of the disc, less than a tenth of the diameter in breadth, the magnitude of the Eclipse being o 938

ECLIPSES OF JUPITER'S SATELLITES.

This Table gives the Greenwich Time of the Eclipses of the Satellites of Jupiter that will be visible from Greenwich in the year ross and in January 1922. The letters D. and R. in the second column signify respectively Disappearance and Reappearance.

From March 4 to July the disappearances and reappearances take place on the Eastern side of the planet. In January and February, and from September to January and representary and from September to January (1928), the disappearances and reappearances take place on the Western side of the planet. Satellites I. and II. after disappearing into the shadow of the planet reappear at its Eastern limb.

The above list contains the names of all the stars of the 6th magnitude and brighter that will be seen coculted from Greenwich during the year, with the times of disappearance and reappearance. The times of the occultations if seen from other places will be different—earlier in general, if the place is West, later if it is East. Disappearances usually happen on the East or left-hand side of the Moon, reappearances on the West; but the exact position is shown by the figures in the fourth and sixth columns, which give the angle from the North Point or point of the Moon's disc nearest the North Pole of the heavens (as in last year's issue of this Almanack), counting towards the East from c\* to 36c°

The position of a star is defined by its Right Ascension and Declination which have for basis the plane of the Earth's Equator and a certain direction in that plane. Because of certain movements of the Earth these co-ordinates are continually changing. These changes are called Precession and Nutation. A star actually changes its position by Proper Motion (see p. 84), and apparently by Aberration, which has a periodic effect of one year. The position of a star as seen in the sky is affected by these causes and is called the Apparent place. The Mean place on January 1, 1921, given in the Table on the opposite page is the Apparent place referred to the Equator of date with these effects eliminated. For purposes of navigation and surveying it is the Apparent place that should be used, and on this page the Apparent places of some stars are given. The Apparent place of Polaris is given on p. 4 of each month.

(See page 82.) Polaris = a Urae Minoris; Aldebaran = a Tauri; Rigel =  $\beta$  Orionis; Capella = a Canis Minoris; Pollux =  $\beta$  Geminorum; Regulus = a Leonis; Spicas = a Virginis; Arcturus = a Canis Minoris; Antares = a Scorpii; Vega = a Lyræ; Fomalhaut = a Piscis Australis; a Aquilæ = Altair; a Pegasi = Markab; Achernar = a Eridani; Canopus = a Argús. The position of a star is defined by its Right Ascension and Declination which have for basis

The last columns show the intrinsic brightness compared with that of our Sun, which is taken as a star of apparent magnitude -as': on the Stellar scale. a Centauri.—The components of this binary are combined. There is a small star near which is probably a member of the same system. Recently a star of the 1sth magnitude has been found with a large proper motion and a large parallax, which may be added to this list.

THE objects of the sky, Sun, Moon, Planets, Stars, appear to us to be fixed on the interior surface of a hemisphere of which the observer is the centre. Actually the different classes of objects are at very different distances. stars are the farthest away, and individual stars are at great and very various distances from us, and are themselves separated from one another by equally large distances. The nearest star to the Sun is nearly ten thousand times as far from it as is the planet Neptune. It is one of the sims of modern astronomy to investigate the method of distribution of these hodies in space, and their possible movements There are about 10,000 stars visible to the naked eye in the whole celestial sphere, the number including the cases where two or more faint stars close together combine to form one which is so visible. The number naturally depends on the effi-ciency of the observing eye and the clearness of the atmosphere, and the estimate will be less generous if stars to magnitude 6 o and no fainter are included, which is sometimes taken as the limit of naked-eye visibility. The whole number of stars down to this limit of magnitude is 4,300, of which more than 3,000 are visible during the year from latitude 60°. By the aid of the photographic plate objects are detected and recorded which no eye can see, even with the best optical aid. One hundred millions is an under-estimate of the number of stars already photographed, and it may be supposed that this number would be much increased with increased exposure. The Yerkes telescope, whose object glass has to inches diameter, will just show stars of the 17th magnitude. A star of magnitude at has heen photographed

#### THE MILKY WAY.

It is believed that the great mass of the stars that we are considering are arranged in space in a form which may be likened to a watch or lens. In other words, our stellar Universe is considerably flattened on both sides, and the median plane is marked out in the sky by the band of star cloud of irregular shape which is seen star cloud of irregular shape which is seen crossing the sky on a clear night, known as the Milky Way or Galaxy. Our Sun is not precisely at the centre of the lens, but is probably not far distant from that point. Any estimate of the size of this Universe of stars can at present be little more than coujecture, but 3,000 light years (see p 85) may be taken as a minimum estimate of the length of the radius of the section in the median plane. This Universe is more densely populated in the region of its central plane, called the Galactic plane, than elsewhere. On either side of it the stars he thick, but the number becomes progressively less as the distance from that plane increases. until at the poles they are relatively few. Around the circumference of the lens is a huge ring or girdle made up of stars, generally very faint, because of their distance, clusters of stars which appear like stellar clouds, and nebule. These agglomerations of celestial matter make up the appearance we recognise as the Milky Way. It is suggested that in the space which way. It is suggested that in the space which though the process is difficult and slow, several comprises the Universe of stars there is dark obscuring matter which is the immediate cause of some of the dark patches in the Milky Way.

As seen in the sky the Galaxy always passes through the same constellations, sharing with them the diurnal motion, but its direction bears on special relation to the direction of the that these classes are nearest to us. It has

Ecliptic, Equator, or horizon. Such a relation is not to be expected, for these three planes pertain only to our Sun and Earth, which are minor bodies of the Cosmos of which the Galaxy is a main outstanding feature.

#### STAR SPECTRA

Most of the bright stars and many of the fainter have been examined with a spectroscope, and have been divided into classes according to their type of spectrum as indicated by the lines their type of spectrum as indicated by the which cross them. The spectral types are marked by the letters O, B, A, F, G, K, M, and the order as written is supposed to indicate in some way the order of evolution or growth of stars, but there are divergent theories on this point. The stars of the first two classes, O and B, have spectra characteristic of helium and hydrogen, and have some affinity to planetary nebule.

Stars whose spectra range between A and F—
and it is to be remarked that there is no rigorous line of division between the classes-are white or blue stars, and in their spectra the absorption lines of hydrogen are conspicuous. In the next groups—F to G, and G to K—lines characteristic of metals appear, fine but numerous, and the stars of this class are yellow. The spectrum of our sun falls within the group F to G. The spectra of the remaining classes, K to M, indicate a lowering of temperature, and the stars are red. Antares, Beteigeuse, and a Herculis are notable stars of this type

#### STELLAR MOTION.

Many, if not all, of the so-called Fixed Stars are gradually changing their positions relative to one another, the movement of each star being called its Proper Motion. Consideration of these proper motions has led to the conclusion that they are in part due to an actual movement in space of the star itself, but in part to the movement of our own Sun, which causes an apparent motion of the star in the opposite direction, this In this way, it has been found fairly conclusively that the Sun, and with it the Earth and planets, is moving through space with a speed of 10.5 kilometres per second towards a point on the celestial sphere not far from the bright star Vega. speaking roughly, but the precise position of this point is not yet known. This movement of 10 5 kilometres per second being established, if by any means it is possible to find out the mean parallactic movement of a group of stars, the mean parallax, or distance of this group from us, follows from a simple computation. In other words, the space through which our Sun travels, which is about twice the diameter of the Earth's orbit in a year, is taken as the base line with which to measure the distances of the stars.

#### DISTANCE OF THE STARS.

The direct method of determination of s-star's distance or stellar parallax, consists in measuring the minute difference of direction of the star, as seen from opposite points of the Barth's orbit, and

The times given are approximately those of the middle of minimum phase,

already been mentioned that our Sun is of this spectral type. A method has been evolved for finding the absolute intrinsic brightness of a star by examination of its spectrum. Com-parison of this brightness with the star's apparent magnitude gives a measure of its distance, which is the most recent way of finding stellar parallax. If a sphere be assumed round the Sun as centre with a radius of a hundred billion miles. there are within it, so far as is known, about so The nearest of these is the bright star a Centauri and its companion The immense distances of the stars are measured in terms of the space that light moves through in one year as unit, which in miles is 6 followed by zz zeros, or the parsec is taken as unit, which is 31/4 times the light year and is represented roughly by a followed by x3 zeros. A short list of some of the nearest stars is given on p. 83. It will be seen that this comprises some of the faint stars which are therefore of small intrinsic luminosity (Dwarf). On the other hand in the list of bright stars on the same page there are some which are very distant, and these must therefore be intrinsically of great magnitude (Giant).

#### VARIABLE STARS.

Although the stars generally shine with unchanging brightness, there are some among them which are exceptions to this rule, and of these Algol, the star \$\tilde{B}\$ of the constellation Perseus, is the best known. In general this star is of nearly the second magnitude, but at stated intervals of something less than three days it fades away to nearly the fourth magnitude, remains so for about so minutes, and then regains its light. The whole eclipse occupies about 9 hours. The approximate times when this star will be at minimum in the months when it is suitably placed for observation are given in the table above. The position of Algol is given by R. A. ab. am. Beclination acc of N.

table above. The position of Algol is given by R.A. jh, jm, Declination  $qo^2$  jg' jh. There are variable stars of types other than the Algol. The Cepheid variables have an average period of about jh days, and the rise from minimum to maximum takes only about one-third of the whole period, so that the decrease of light is more gradual than the increase. Stars of the  $\beta$  Lyrse type pass from minimum to minimum in about  $6j'_{h}$  days, but are not of the same brightness at all minima, the alternate being equal. There are variable stars of long period (about 326 days) of which Mira Ceti is the most fanous and others more capricious in their variation whose peculiarities can scarcely be summarized.

## NEW OR TEMPORARY STARS.

The phenomena known as "Novae" or "New ' Stars can scarcely be classed as variable stars, for the rise to maximum, so far as is known, occurs only once in their history. Generally the Nova appears in the place of a star of faint magnitude, already catalogued or photographed, which blazes out into conflagration in the space of a The great brilliancy is few days or hours. almost as short-lived as the increase in light, and then follows a fall, more or less steady, and in a few months the object emits, perhaps, a per cent. of its light, whilst in a decade it has fallen to its original condition and luminosity. these changes go on the spectrum undergoes equally remarkable variations. The few observations that have been made during the increase of brightness show a spectrum of the ordinary type crossed by dark lines which are much displaced from their normal position. Just as the maximum light is reached the spectrum is full of bright bands fianked by dark lines on the side of the shorter wave length towards the violet. The lines of hydrogen are most conspicuous, but helium is present, and other bands can be identified with enhanced lines or lines which are produced in the laboratory when metallic vapour is very strongly excited to luminosity by a powerful electric spark. Later on as the light begins to fall the characteristic nebular lines in the green and violet make their appearance and become the most conspicuous feature of the spectrum while the other lines fade away. At a still later stage the spectrum resembles that of the nucleus of a planetary nebula or of one of the Wolf-Rayet stars which are found here and there in the Milky Way. A Nova found in Aquila early in June, 1928, went through the course above detailed and according to observations made at Stonyhurst arrived at the planetary nebula stage early in August of that year. neous stage carry in a constraint of the constra nights later. It then declined quickly, and on August 30 was only of magnitude 4. A more gradual loss of light then occurred and the star disappeared as a naked eye object on September as, having remained visible for 24 nights. A list of recent bright Novae which have appeared and been detected is given, and Novae which have not been of naked eye visibility are not infrequently found on photographs. There are records of appearance of these temporary stars as, early as 224 B.C. There were none hetween 1500, and 1848, but, since the latter date there

Solar Pavaller

Parsec . . .

have been as visible to the naked eye as under. With the exception of the second, all have been in the region of the Milky Way.

Very brilliant oval nebula, visible to naked eye A large nebula. Fine double cluster, visible to naked eye.

The well-known "Crab Nebula" of Lord Rosse. Large and splendid nebula, visible to naked eye. A fine cluster of stars.

Great "Looped" nebula—visible to naked eye Magnificent cluster of stars. Called "Præsepe," or the "Bee Hive"—visible to naked eye.

Great nebula surrounding  $\eta$  Argûs.

Brilliant spiral nebula. Splendid cluster of stars.

Very fine cluster of stars, visible to naked eye. Fine cluster of stars.

Bright planetary nebula.

Beautiful ring of bright nebulosity.

Large nebula formed like a "Dumb-Bell" or "Hour-Glass."

Splendid globular cluster of stars. Magnificent cluster of stars.

#### THE AURORA BOREALIS.

M 15 | 21 26 + 11 49 Pegasus ........

This phenomenon is more terrestrial than celestial, and this paragraph, with that which follows, would have been more suitably placed in a later section. It sometimes happens that an unusual luminosity is seen in the northern sky in the form of streamers, arches, and condensations, and it is desirable to record the varying phases and times of these features. It chiefly manifests itself at pretty regular intervals of about eleven years, and seems to be associated with magnetic disturbances and Sun-spots, which have similar periods. The surera is because regarded as showing the cuter limit of our atmosphere, and its height has been determined. The general result is that the elevation of an surera is between so and so miles. The great rewards to miles high, and there are few above see miles. There is some suggestion that, with magnetic storms, the seriod of their appearance follows that of the Sun's spacetic

rotation (a7% days). On March as 1920, there was a very extended group of spots at the middle of the Sun's disc, a magnetic storm, and splendid display of aurora during the night. Such coincidences are not unusual (see p. 87).

#### THE ZODIACAL LIGHT.

This is an appearance which is little understood, and therefore deserves the attention of observers. It shows as a band of faint light which stretches up slantingly from the Sun before sunrise in the autumn months and in the evenings in March. It may be the manifestation of a widely scattered appendage of the Sun or a vast concourse of slightly redective meteoric systems. It has been asserted that it is a mere atmospheric effect, but this is not consistent with some of the chief features of its appearance. That it has a celestrat origin seems certain, but its true nature is not clearly distinguishable on the evidence before us.

make up the Universe, and, so far as human knowledge goes, is not unlike many of the stars we see in magnitude and constitution. surrounded by a family of smaller bodies of which our Barth is one, and the Solar system, which is only a minute detail in the structure of the Universe, is the observing station from which we look out in all directions across the great distances which separate us from the other members of the stellar system

The Solar or Planetary system consists of the Sun, with eight major planets and a thousand minor planets, or asteroids, circulating round him at varying distances in oval-shaped orbits. Six of the major planets have smaller bodies circulating around them, so that each forms a separate system, but all the bodies receive their

light and heat from the Sun.

The periodic comets which return to perihelion at regular intervals, since they move in elong-ated elliptical orbits of which the Sun is at one focus, are also members of the Solar system, but

shine partly by their own light.

The plane of the Ecliptic in which the Earth moves round the Sun (see p. rox) is used as a fundamental plane of reference. The other The other planets move, at varying distances from the Sun. in planes inclined but little to the plane of the Ecliptic, and describe orbits in periodic times which are connected with the distances by a certain relation known as Kepler's 3rd law. The squares of the periodic times vary as the cubes of the semi-major axes. Following are given brief notes on each of the hodies which make up the Solar system, with details of their sizes, distances from their primary, and periodic times in tabular form. The time of rotation about the axis, or the length of the day of the planet, is added where this is known.

#### THE SUN.

The surface of the Sun presents a mottled appearance, and on it black spots appear sporadi-The nature of these is not known with cally certainty, but it was formerly supposed that they are at a lower level than the surrounding surface, the photosphere, though some modern views assent that spots are due to a central uprush. They are evidently signs of some solar activity which influences the magnetism of the Earth. for the coincidence in time between certain variations of terrestrial magnetism and of magnetic storms on the earth with the appearance of sun-spots is too marked to be fortuitous. It is suggested that the connection is made by stream-like emanations of corpuscies from the Sun which envelop the earth. The spots vary in size and number, and their total area reaches a maximum about every eleven years. They seldom appear more than 30° of latitude from the solar equator, north or south, and the spotted regions converge towards that equator as the time of minimum approaches. A record is kept of the appearance and positions of the spots on the solar disc, and from these positions the latitude and longitude of the spots on the Sun's surface (Heliographic) can be computed. Sun's surface (risingraphic) can be computed.
Elements necessary for this computation are
given on page s of each month. The Sun rotates
on its axis in about as days 8 hours, which is
shown by the apparent movement of the spots.
They cross the visible disc from the esstern to the western edge in 13 or 14 days, the average period of the Sun's rotation with respect to the

THE Sun is one of the millions of stars that | Earth being 27% days, because of the orbital ake up the Universe, and, so far as human movement of the Earth in the interval. Like Jupiter, the Sun appears not be rotate as a whole, the period of rotation being different in different latitudes. The Equator makes a complete rotation in less than as days, whereas the period for latitude 35° is nearly 27 days. The number and size of the spots in 2500 showed a marked decline, though there were occasional notable outbursts.

When the intense light of the Sun is shut off by the interposition of the dark body of the Moon in a total solar eclipse, certain red prominences are seen projecting from the Sun's edge, which consist of masses of glowing hydrogen gas arising from the chromosphere, some-times of a remarkable shape and extending to enormous heights, occasionally being actually detached from the body of the Sun. In the lower strata of the Sun's envelope are found the vapours of many metals, known by their characteristic lines shown in the spectroscope. Another appendage to the Sun outside the chromosphere is called the Corona, and can only be seen during total eclipses of the Sun. The lower portion consists of a pale green light containing hydrogen, the upper is a beautiful mass of silvery white light, in form of feather-like plumes, with dark spaces between, which have been traced from the Sun's edge to a distance as great as twice the Sun's diameter. corona does not retain a constant form, but appears to vary in shape and extension according as the eclipse occurs at the period of maximum or minimum of Sun-spots. Solar eclipses are only total at a certain region on the globe, this being the place or places where the shadow of the Moon falls, and an eclipse is partial at localities off the line of totality, because the change in the observer's position puts the Moon out of the direct line joining her to the Sun Total eclipses of the Sun are rare in this country There will be an eclipse in June 1927 which will be momentarily total from a track running across North Wales and North-West Yorkshire. Sometimes on the occasion of a central eclipse the Moon is at such a distance from the Earth that the Sun's disc is not quite covered, and a ring of light is seen round the eclipsing Moon. An annular eclipse of this kind will be seen from a region in the North of Ireland and Scotland in April of this year (see sp. 38 and 80) and preparations are being made for observation of Total Solar Eclipse from the Indian Ocean in September ross.

#### MERCURY.

Mercury is the nearest planet to the Sun, and the smallest in the system. Because it moves in an orbit between the Sun and the Earth this planet can never be seen far from the former body, and is sometimes to the West, sumstines to the East of the Sun. In the former case Mercury appears as a morning star and in the latter as an evening star. The extrames of these apparent expursions are technically known as Elbugations, and the times and distances, measured by the angle included between the lines which ioin the Earth to the Sun and the plane respectively, are given in the third page of each month. The great ellipticity of the orbit of Mercury causes the amount of these Elongations to vary considerably, and they may be as small as 16° or as large as 20°. The period of revolution round the Sun—in other words, Mercury's year—comprises 88 solar days, and he turns on his axis either in the same time, and therefore always presents the same face to the Sun, like the Moon with respect to the Earth, or in about as hours. Mercury shows phases to the Earth—like the Moon in her first quarter if the elongation be in the East, and like her last quarter if in the West.

## VENUS.

Venus, which is nearly twice as far from the Sun as Mercury, is almost exactly the same size as the Earth. Her apparent movement with respect to the Sun is similar to that of Mercury, except that, being farther from the Sun, and nearer to the Earth than her smaller neighbours, the angles of Elongation exceed those of Mercury, and extend to 47°. The disc of Venus is not telescopically interesting, for owing to her dense cloud-laden atmosphere very few markings are visible, and this renders a determination of her axial rotation uncertain. By some astronomers her day is believed to be very nearly equal to that of the Earth, whilst others have concluded that it is equal to the year of Venus, or, in other words, that the planet always presents the same face to the Sun. Venus has epochs of great brilliancy when she appears as a beautiful creacent like the Moon when about g days from New. Such epochs will occur in the current year in March and May (see p. 4s). The brightness is not the same at all the maxima, but this varies periodically, and the evening maximum in March of this year is a specially bright one.

#### MARS

Mars, the first planet whose orbit is exterior to that of the Earth, is a little larger than Mercury and considerably smaller than Venus and the Earth. Details of his distance and period will be found in the table. Mars is in opposition at intervals of about two years, because it moves at a rate not greatly different from that of the Earth, and it will not be at opposition, and therefore not very conspicuous in the year year, at least until the end of the year. Mars, like Mercury and Venus, exhibits phases, but in a much less degree than those planets. His disc departs from exact circular form, or is gibbous only to the extent of one-cipith of its diameter. The other superior planets are too far away to show any very appreciable phase, though traces of it are sometimes to be detected in Jupiter.

planets are too far away to show any very appretable phase, though traces of it are sometimes
to be detected in Jupiter.

Unlike Mercury and Venus, Mars exhibits
many well-defined markings, which enable his
rotation period to be well ascertained; there
are, besides, white spots at the poles of rotation
These are supposed to consist of snow, and when
it is summer to the Martians in the norther
them in to
orbits are be
disappear entirely, which it does not
disappear entirely, which it does rarely. The
remainder of the disc is divided into greyish
and lands. The Maris are not now generally
considered to be oceans, but are usually regarded

as marshes or areas covered with some sort of vegetation. These areas are seen to change their colour and intensity with the Martian seasons very much as our vegetation would appear to do if viewed from a celestial neighbour. Certain fine, dark, straight markings seen across the ruddy areas have been named "canals," perhaps a little unfortunately, as it has been taken to imply that they are of manual construction, but for this there is no sufficient evidence or proof.

#### MINOR PLANETS.

Between the orbits of Mars and Jupiter a large number of small planets have been discovered, and every year a considerable number are added to the list. At present the total number known is about a thousand, and there may still be thousands awaiting detection. It has been estimated in a recent Memoir that there are perhaps 80.000 minor planets brighter than the soth magnitude, but that comparatively few brighter than the xath magnitude remain undiscovered. The four largest, found in the early years of the xoth century, are—Ueres, 485 miles, Pallas, 304 miles; Juno, xx8 miles; and Vesta, 243 miles Vesta is the brightest though not the largest. In recent years the discoverie-have been of much smaller objects, and it is probable that some of them are not more than from xx to zo miles in diameter, and are perhaps nothing more than great masses of rock flying round the Sun.

The periodic times of their revolutions vary considerably, amounting on an average to about 2,600 days, or 4½ years. Some of the orbits are very oval and the inclination of their planes to the Ecliptic varies considerably; in the case of Pallasit amounts to 35°, that of Juno being only 13°. One of these small bodies, named Eros, at some oppositions approaches nearer to the Earth than Mars does at any time, and thus affords a good opportunity for determination of the solar parallax. Oppositions happen at intervals of about 2½ years, the circumstances being very different at the different occasions. There will be one towards the end of year 132x, another and a more favourable one in 1924, and there will be a very close approach at the opposition 1 1921.

#### JUPITER.

The next planet in order from the Sun, Jupiter, is the largest planet in the system, and has a diameter eleven times that of the Rarth, but the density is only \( \frac{1}{2} \) th of the latter. On viewing Jupiter through a telescope it will be seen that the disc is not circular, but its form, an oblate spheroid, is believed to be due to the rapid axial rotation, which causes a flattening at the poles and bulging outwards at the equator. The same effect is produced on all the planets in more or less degree. Jupiter has four principal satellites about the same size as our moon, which were the first celestial objects discovered with the telescope, Galleo having observed them in the year 167c. The planes of their orbits are but slightly inclined to that of Jupiter about the Sun, and in consequence eclipses of the three inner moons, which shine by the light of the Sun, occur every Jovian lunation, their distance from Jupiter not being large enough to permit them to escape the shadow, as is the case with Satellite IV. In some circumstances. A period of about three years begins at the end of this year when the fourth satellite will not be eclipsed.

#### THE GREAT RED SPOT ON JUPITER.

This may be considered the most remarkable and the best observed planetary feature of modern times. There is record of an observation of a spot by Hook in 1664 which may have been an early appearance of this, but the first modern observation was by the Rev. W. R. Dawes when he figured it in the form of an ellipse resting on the south equatorial belt of Jupiter on Nov. 27, 1837. It came again into prominence in 1878 and the following years A curious bay or hollow on this bett has been visible since 1831; and if we accept this as identical with the one now visible (which includes the red spot), then the rotation of this object during the 84 years from 1831 to 1914 was

object during the \$4 years from 1831 to 1914 was 9h. 55m. 36 9c. from 74.79 rotations.

In the early months of 1919 the great red spot and its immediate surroundings underwent some surprising changes. The bay or hollow in the S. side of the southern equatorial belt disappeared, and the red spot seemed almost obliterated. The south tropical disturbance, visible since 1901, consisting of an extensive dusky marking reaching halfway round the circumference of Jupiter, and situated in the usually bright 20ne between the southern side of the south equatorial belt and the south temperate belt, apparently disappeared. The apparition of 1919-20 was again remarkable. The features mentioned above, the Bay, the Red Spot Hollow, and the S. Tropical disturbance, had all reappeared, and the Red Spot, though without its colour, was well defined and of abnormal length.

At the opening of the year 1931 the position of the latter object will be approximately \$5°, or 140 minutes, preceding the zero meridian (System II.) of Jupiter, and if the previous motion is continued, the values above given will increase at the rate of about 4°, or 6° minutes per month. There is much to repay a careful study of the portion of Jupiter's surface referred to through adequately powerful telescopes. The transits of the zero meridian (II.) of the planet on various dates in 1921 will be as under.—

The times for other dates may be found by adding periods of oh. 55m. 40s.

Note.—Two systems are in use for defining the positions of markings on Jupiter. In System I., which pertains to the rapidly moving Equatorial Zone of the planet, the period of rotation is taken as 9h. 50m. 30s System II applies to the Temperate Zones, and in this the time of rotation is 9h. 53m. 40 52s

### SATURN.

The sixth major planet in order from the Sun is unique in appearance because of its encircling ring-system, which renders it magnificent as a spectacle and an interesting object for telescopic observation. The system consists of three bright rings and an inner duskyzing through which the body of the planet can be seen. The rings appear to be flat annular discs of extreme thinness, inclined at an angle of \$60 to the plane of the Ecliptic, and it is shown that neither of them

can be a coherent mass or in one piece, either solid or liquid, as in that case it would be difficult to account for their stability. They probably consist of an immense number of minute bodies revolving like satellites round the body of the planet. Of the three bright rings the middle is the brightest. I wice during Saturn's period of revolution of sply years, the plane of the Ring will pass through the Sun's centre, at intervals of about 13½ and 16 years. Such an occurrence will happen this year—the last was on July sp, 1907—and will give rise to the circumstances mentioned in the note on page 38. Betts like those on Jupiter, but of not so pronounced a character, are seen on Saturn. His figure shows a bulging at his equator, the ratio of the polar to the equatorial diameter being as 14 to 15. Saturn has ten satellites, situated outside the

Saturn has ten satellites, situated outside the rings, some of which are visible in telescopes of low power. Titan, the largest, is about one and a half times the size of our moon, whilst Iapetus is about the same size as our satellite.

### URANUS.

Discovered by William Herschel at Bath in 1981, this planet is only just visible to the naked eye. In a telescope Uranus may be distinguished from the stars around by his disc, which is obvious though less than 4" in diameter, and by the quality of his light, which is less piercing than that of the stars. Very little is known about his surface markings, but a rotation period of 12 hours 42 minutes has been inferred from the observed variability of his light, which has been supposed to be due to some specially reflective spot coming into the Sun's rays. A determination of the rotation period by the spectroscopic method agrees with this. Uranus will be favourably situated for observation in the autumn months in rear

#### NÉPTUNE.

This planet, placed on the confines of the Solar system, is a small telescopic object of about the 8th magnitude. He will occupy nearly a stationary position in Cancer, and may be observed with best effect in the early months of this year.

## THE MOON.

Neither Mercury nor Venus, so far as is known has a satellite; the one satellite of the Earth is the Moon, which is quite familiar to us. The mean distance of the Moon from the Earth is about 239,000 miles—near enough for us to get a more complete knowledge of its surface conditions than we can of any other member of the Solar system When viewed through a telescope, charts of very great accuracy can be made of her surface; as she has no appreciable atmosphere to obscure the more delicate markings. Only one side of the Moon is seen, and from this fact we inter that she moves round the Earth. As there is no sign of water or vapour on the disc, and consequently no atmosphere, the surface must be exposed to the most violent changes of temperature: in the lunar day of half a month it must be heated to a very high temperature, and in the other half subjected to cold equal to that of interstellar space. Her diameter, is rather more than a, 16c miles, and her rate of motion through the firmament 12° xo' 35" per day and 35' 50' per hour. Thus she travels over a space slightly exceeding her own diameter in one hour. The sctual time she takes to move around the Earth is 37d. 74, 43m. 13' 15', but

the time from one New Moon to another is and. xal. 44m. as. When seen through a telescope the surface of the Moon presents many objects of great beauty and interest. A small in-strument will show the chief "seas," plains, mountain ranges, ring-plains, and crater-pits. The phases of the Moon occur because only a half of the lunar sphere is bright at any one time, and we on the Earth may, or may not be in a peation to see the whole of that bright hemisphere.

When the Earth passes between the Sun and Moon, the Earth's shadow sweeps across the Moon and causes a lunar college, which may be either total or partial as in the case of solar colleges, but there is this difference—that a lunar college is visible to all observers where the Moon is above the horizon at the time. The consumer to the constant the time. The obscuration of the Moon's disc is hardly ever complete, but because the Sun's light is scattered by the clouds in the Easth's atmosphere, the Moon appears usually as a dark copper-coloured disc. From what has been said above, it will be understood that solar eclipses are take relace pales. When Moon and these can take place only at New Moon, and lunar eclipses only at Full Moon.

In a note on page 38 it is stated that the small daily retardation of moonrise, which is the essential characteristic of the Harvest Moon, occurs each mouth, though not always at the Full Moon. The retardation depends essentially on the inclination of the lunar orbit to the horizon at time of moonrise, therefore in some degree it is a question of latitude, and in Northern latitudes, when the longitude of the Ascending node of the when the longitude of the Ascending node of the Moon's orbit is o', this minimum daily retardation is small. In the year 1913 the longitude of the node in 8 sptember was 340, and the difference between time of rising on consecutive days at Full Moon was 8 or 9 minutes only. The present position of the node does not give such a small. possion of the node does not give such a small retardation, but the minimum has almost its greatest value. Though there are differences in the details of the phenomenon, the expression "Harvest Moon" is held to apply in all cases to the Full Moon which happens nearest the Autumn Equinox, whist that which follows is called the Hunter's Moon.

### A FEW OF THE CHIEF LUNAR FORMATIONS.

Wedge-shaped Valley of the Alps.—Near the central line of disc, towards the north, a cleft 83 miles long and 31/2-51/4 miles broad

Apennines. - An extensive mountain range somewhat similar to terrestrial features. Vimble to naked eye when projecting into the dark part of the disc. Length, 460 miles; highest

summit (Huygens) reaches #8,000 feet.

Aristarchus.—A hunar crater in N.E. quadrant
The brightest object on the Moon. This crater

is visible as a luminous spot when all the surrounding region is involved in shadow

Mare Crustum.—A dark grey oval plain visible to naked eye near W.N.W. limb of Moon. Extends also miles N. to S. and 324 miles E to W. Well seen five days after new or a few days after full.

Mare Serenitatis.—Lies S of the Moon's centre, and extends over 428 miles. A nearly circular dark plain. Contains a crater, Linne, formerly suspected of change This mare is visible to naked eye.

Clavius. - One of the finest craters on the Moon, and about 14s miles in diameter. Situated on

S. limb.

Tycho.—Towards S limb. Has been called "the metropolitan crater of the Moon." A fine crater 54 miles in diameter and 16,600 feet deep. Central hill nearly a mile high. Tycho is the centre of a remarkable system of bright rays radiating from it, and they are very conspicuous at the time of full moon. In its region (8, limb) the Moon's surface is 50. studded with craters that it resembles an immense honeycomb

#### COMETS.

In addition to the planets, there are other interesting objects belonging to the Solar system, called comets. Some of these revolve in elliptical orbits, and the periodic times of those whose return has been observed range from 3% to nearly 80 years, whilst a few other computed orbits show periods as large as a million years. Other comets move in parabolic courses and apparently do not repeat their visits to the Sun.

Comets revolving around the Sun in comparatively limited times are not very numerous, but our knowledge of them is constantly becoming more comprehensive and accurate. These small returning comets revolve in periods from 3½, to 9 years, and deserve special notice, as their orbits are well known and predictions of their reappearances can be accurately made in many CHMO

Their paths extend outwards to the position where Jupiter performs his revolution, and from this circumstance they are termed Jovian comets.

	April		Barnard	1884
	September	5'400	Neujmin	1016
	September		Perrine	
	October	. 6'480	Daniel	1000
	November		Spitaler	
	November	5 456	Brorsen	

The comets of this class move in elliptic orbits not much inclined to the Ecliptic. Without exception they travel in direct courses, and in these respects present an analogy to the planets, but of those that move in very long ellipses, or parabolas, about two-thirds have a retrograde (westerly) motion.

There are other families of comets, none so the Jovian, named respectively from the planets Satura, Uranus and Neptune, for reasons similar to that given above. Halley's comet belongs to the Neptunian family

The most probable date for the return of Di Vico's comet of 1846 is November 1921, but as the period is uncertain by 2 or 3 years a later return is possible.

In zee Tempel-Swift's comet, first discovered

in 1865, was reobserved.

In the life of a comet the tail sometimes appears to undergo very rapid and curious changes. From examination of the spectrum of the head, comets appear to consist of carbon in various forms, and cyanogen has also been detected. Secondly, there are bright metallic lines due to sodium, magnesium and iron which appear only when the comet is near perihelion, and in some cases have become very strong upon close approach to the Sun. The spectrum of the tail shows certain characteristic bands that are due to carbon monoxide of very low density. Generally a continuous spectrum is shown as a background to the bright lines, from which we infer that a part of the comets' light is due to reflected away from the Sun, as if acted upon by some repulsive action—perhaps light.

#### METEORS.

Another class of objects which belong to the Solar system are the metaoric streams, giving rise to occasional showers of meteors, falling stars, or fire-balls, which are all the same class of object, the distinction being only one of size. They are visible in varying number on every night of the year, and are sometimes so abundant as to form striking phenomens. The year

rgas was notable because of a remarkably abundant and previously unknown stream on June s8, which had a distinct connexion with Pons-Winnecke's periodical comet, the orbits being nearly the same. This comet will return again to perihelion in the summer of sess and may produce an abundant and brilliant meteoric shower at the end of June. Meteorites are composed of terrestrial elements, iron, shromlum, magnesium, and nickel being in large proportion.

## Greenwich Mean Time.

Time, in the abstract, is measured by the distance described by a moving body, or machine, when the velocity of the same is sustained with perfect uniformity. Our retaining Earth is the moving body used to measure time, and a solar day is the duration of a complete rotation of the Earth round its axis with respect to the Sun. The speed of the Earth's rotation is itself uniform, but as it is here estimated with reference to the Sun, the length of the solar day is affected, first by the movement of the Earth in its orbit round the Sun, which is not always at the same rate because of the ellipticity of the orbit, and also by the circumstance that the axis about which the Earth rotates is not perpendicular to the plane of that orbit. Clocks are adjusted to an average or mean solar day which is of uniform length and is divided into as equal hours. This is the basis of Mean Solar Time.

A unit and method of measurement having been established, it is necessary to choose a zero. The zero adopted is the instant when a fictitious hody known as the Mean San, which is sometimes before, sometimes behind the real Sun in its apparent diurnal journey round the Earth, is on some chosen meridian. The meridian chosen being that which passes through some particular place, the time is called the Local Mean Time of that place. Usually some standard meridian such as that of Greenwich, is chosen, and the time of that meridian is used throughout a whole country, and hence the expression Greenwich Mean Solar Time, or, more usually, Greenwich Mean Time at isses (see Zone Standard Time, p. 93).

## Apparent Solar Time.

The time shown by a undial is affected by the two causes mentioned, which make the length of a solar day not uniform. This is called Apparent Solar Time, and differs from Mean Solar Time by the Equation of Time which is given in the second column of page z for each month, and is to be used according to the precept in the heading.

#### The Astronomical Day.

For purposes of Astronomy the day begins at moon, and the hours following noon are numbered successively from c to sy. There is therefore no use of the letters A.M. and P.M. in astronomical tables, but January zd. szh. is the equivalent of January zd. szh. in astronomy is recognised as being January zd. szh. in astronomy is recognised as being January zd. szh. p m of ordinary inte. In its early years the calculations of the Nautical Almanac were made for Apparent Noon, or the moment when the True Sun is on the meridian of Greenwich, and this still done in some special cases, but at present the abbreviation G.M.T. always indicates the time of a day which begins at Mean Noon.

The use of a day of as hours beginning at noon for astronomical purposes is of great anti-quity, but proposes have requently been made for the unification of the astronomical and civil days. In sase the Lords of the Admiralty, after consultation with the Royal Astronomical Society, decided to take this step, and directed that a day beginning at midnight should be substituted for the Astronomical hay in the Agustical Assense, beginning with the editor reass. A similar asternation had already been

decided on by the French authorities, to take effect from January 2, 1280, and the system has been brought into use in some French official publications. A similar day has been adopted for the first time in this issue of Whitaker's Almanack (see p. s6).

#### Sidereal Time.

A sidereal day is the duration of a complete rotation of the Earth round its axis with referonce to the stars. This is of uniform length, and is divided, like the mean solar day, into as equal hours, which are shorter than a solar hour by about 9.33 seconds of mean time. As the sidereal day is about 4 minutes shorter than the mean solar day (see page 79), it begins earlier day by day by about that amount. The instant of the beginning of the sidereal day in G.M.T. is given on p. s of each month. In actual observatory practice time is measured, and the standard clock is regulated, by this rotation of the Earth with respect to the stars, and Mean Solar Time is derived from Sideraal Time by computation (see below). The error and rate of the siderest clock are found by observing the instant it shows when certain stars, known as Clock Stars, cross the meridian or are due south, and comparison of this with the known time of transit (star's R.A.) will give the error of the sidereal clock. Comparison of the mean solar clock with the sidereal clock will show the error of the former. The same result might be arrived at directly by observing the instant by the Mean Time clock when the stars cross the meridian.

Corresponding Mean Time ... 2 22 4

In the spring of seas the Government adopted as an advantage during the war the principle of a scheme proposed by Mr. William Willett about the year 1907 and an Act was passed, known as the Summer Time Act (1916), the first clause of which runs: "During the prescribed period in each year in which this Act is in force the time for general purposes in Green Britain shall be one hour in advance of Greenwich Mean Time." A committee appointed to consider the working of the Act in 1916 reported in its favour, and Summer Time has been used in the following periods:—

1916. May sid. sh. to Oct 1d. sh. 1917. April 8d. sh. to Sept. 17d. sh. 1918. Mar 24d. sh. to Sept. 30d sh. 1919. Mar 30d sh. to Sept. 39d. sh. 1980. Mar. s8d sh. to Oct 25d. sh.

The hour being Greenwich Mean in each case. (In 1920 the ending of the period was postponed for four weeks for special reasons.)

The largest telescope in the world is the Hooker reflector with objective mirror see inches in diameter, which has lately been brought into use at the Mount Wilson Observatory, California.

# Zone Ständard Time.

In the year also it was enacted by statute that the word "time," when it occurred in any legal document relating to Great Britain, way to be interpreted, unless otherwise specifically stated, as the Mean Time of the Greenwich meridian. There are other examples of the adoption by nations of the time of their own capital as the Standard Time of the country, but since the year 1883 the system of Standard Time by Zones has been gradually accepted, and now by zone has neen graduanty accepted, and how nearly all the countries of the world use as Standard the Time of some meridian which differs from that of Greenwich by a multiple of 15°, and therefore differs from Greenwich Mean Solar Time by an integral number of hours, without for a ploy. either fast or slow. In a few cases differences including a half hour have been adopted

The countries in which Standard Time has been adopted according to this scheme are given in the accompanying table. In the large territories of the United States and Canada it has been found expedient to adopt five different standard times, the territories being divided into five by meridians, 7½° on either side of the five central meridians. This arrangement is not five central meridians. This arrangement is not strictly adhered to, because towns and cities near the dividing lines adopt which of the two times is the more suitable to railway or local reguirements. The same plants followed in Brazil, which is divided into three zones, and in these the time, 3 hours, 4 hours, or 5 hours slow on Greenwich, is adopted as standard respectively.

The time s hours fast on Greenwich is called East-European, that x hour fast is called Mid-European. The time appropriate to Eastern Canada, 4 hours slow on Greenwich, has been called alternatively Maritime, Inter-Colonial, and Atlantic Time The standard times in use in the other four zones of the North American continent are called respectively Eastern, Central, Mountain, and Pacific Time.

It will be inferred from the above table that when it is noon at Greenwich on any day of the week, it will be midnight of that day in the Fiji Islands but half-past twelve in the morning of that same day in Samoa. In other words, at half an hour after midnight of Wednesday in Samos, it is midnight of Thursday in Fiji, though these two places are separated by a compara-tively short distance. In a vessel which is travelling westward this fact necessitates the omission of a day from the week, and in the case supposed, Thursday would be omitted from the log and the record would pass directly from Wednesday to Friday.

ZONE TIME AT SEA.

A scheme analogous to the Zone-time system was arranged and adopted by the Admiralty for the use of ships of H.M. Navy in 1919. The clocks used for ordinary life on board a vessel now show the time of the zone in which she then is, an adjustment being made when the ship enters each zone. A zone extending from 7½° longitude east of Greenwich to 7½° long. W. is the zero-zone, and zones each 13° of longitude wide westward of this are fumbered + 1, + 2, + 3, . . . up to + xs for that part of zone zs lying east of the date line (x8oth meridian approximately). Similarly zones eastward are numbered - 1, - 2, - 3, up to - 12 for that part of the zone lying west of the date line. This "zone description" is given in any record of time by a clock, and from this the Green ich Time of the event recorded may be inferred by addition or subtraction as shown by the sign.

SCIENTIFIC CHRONOLOGY is not yet a hundred years old, and in so far as it deals with the s of the world in which we live, it may be said to have its origin in the researches of geologists and ethnologists in the nineteenth century. These researches ted to the discovery of extinct als buried under a surface which was magnitudes of years in formation. The geological measure of time is the period occupied in the stratification of rocks, with allowances for intervals between the periods. By this measure the conjectural age of the World varies from 40 forman millions magnet. to see million years.

Geological Chronology.—The periods of stratification of the Earth's crust are classified by geologists as shown in the following list, each period having sub-divisions:—

I. ECROIC.
II. PALEOZOIC OF PRIMARY.

1. Cambrian.

11. Silurian.

111. Deponian or Old Red Sandstone.

iv. Carboniferous. v. Permian.

III. MEENEOIC OF SHOWNDARY.

i. Triassic.

II. Juramic.

iii. Louer Cretaceous.

- iv. Upper Cretaceous IV. CAINOZOIC OF TERTIARY.
  - i. Rucene. il Oligocene.
  - ili. Miocone.
  - iv. Pliocene.
  - V. QUATERNARY OF POST-TERTIARY. . Pleistocene or Glacial
    - 11. Recent or Post-Glacial.

No dates are assigned to these periods, as they are too indefinite and remote for comprehension. Traces of human life are found in V. i and ii., which correspond with the Bolithic, Palmolithic, Neolithic, Bronze, and Iron Ages of our next paragraph.

Ethnological Periods .- The terms employed by ethnologists cover periods which reach to the more recent geological divisions of time and extend to the present day. They are periods, not of time, but of culture, and are of local application only. The terms in use are:—

- Eolithic, or Dawn of the Stone Age.
   Palscolithic, or Older Stone Age.
- 3 Neolithic, or Later Stone Age.

4. Bronze Age. Early Iron Age.

Of these periods the last three can be dated for Europe as follows :-

> Neolithic ends about 2000 B.C. Bronze Age ends about 2000 to 500 B.C. Early Iron Age from about 500 B.C.

Various systems of Chronology are dealt with in alphabetical sequence in the following list —

Abyesinian. - The Ethiopians have a chronological system which starts from the first day of the reign of the Roman Emperor Diocletian and proceeds in cycles of gas years, commencing at a again upon the completion of each cycle. Their first year began on soth August, s64 A.D.

Armenian. - The Armenians marked their ecession from the Greek Church by adopting it as their epoch. This corresponds to oth July, 552 A.D.

Assyrian or Babylonian.—In the eighth century B.C. the Babylonians commenced a chronology

with the era of the founder of their Empire. Their epoch corresponds to seth February, 747 S.C. Biblical.—The Christians of Western Europe

made many calculations concerning the date of the Creation of the World, based upon the genealogical tables in the Old Testament. In the seventeenth century James Ussher, Archbishop of Armagh, adopted the system, and Ussher's Notation was thenesforward printed in marginal notes to the English Bible. Ussher's Notation

placed the Creation of the World in 4004 B.C. Christian.—The Christian year was first adopted in Italy in the sixth and was accepted by Engl in the eighth century. The years are distinguished by cardinal numbers before or after the Incarnation, the period being denoted by the letters B.C. (Before Christ) or, more rarely, A.C. (Ante Christum) and A.D. (Annus Domini). The correlative dates of the epoch are the 4th year of the roth Olympiad, the 752rd year from the Founda-tion of Bome, and the 4714th year of the Julian Period. The Christian Era commenced originally on agth March, but in England Christmas Day was adopted as the beginning of the year from the seventh to twelfth centuries, after which time the Annunciation (agth March) prevailed until January : was adopted at the reform of the calendar in 1752. The reform of 1752 (see also "Roman Chromology", p. eg) omitted :x days from the year in order to connect the civil and astronomical years, and thenceforward the New Style was adopted, the previous period being known as the Old Style. Through the omission of the extra day in 1800 and 1900 (which were not leap years) the difference between the Old and New Styles is now 13 days. The Eastern Church employs the Old Style.

Hendu.-In addition to the Muhammadan reckoning there are four eras used in India. The principal astronomical system was the Kalegu-ga Era, which appears to have been adopted in the fourth century A.D. It began on 18 February, 3102 B C. The chronological system of Northern India, known as the Vikrama Nameat Era, prevalent in Western India, began on as February, 57 B.C. The year 1921 A.D. is, therefore, the year 1978 of the Vikiama Era. In Southern India, the Saka Era, with its epoch of 3 March, A.D. 78, was probably founded by Kanishka (whose sway was widely extended), and is in general use. The year rgar A.D is 1843 of the Saka Era. In the Hills, the Saptarshi Era dates from the moment when the Saptaishi, or saints, were translated and became the stars of

the Great Bear in 3076 B.C.

There are many obsolete eras in the history of the Indian Peninsula. The principal religious systems of chronology were those of the Buddhists and the Jains. The Buddhists reckoned from the death of Buddha in 543 B.C. (the actual date being 487 BC); and the epoch of the Jains was the death of Vardhamana, the founder of their faith, in 527 B c

Japanese and Chinese. - Japan in 1872 and the Chinese Republic in 1912 adopted the calendar of Western Europe.

Jewish — In the fifteenth century the Jews adopted as their epoch the Creation of the World, which was placed in a year called in the Unistian chronology 3768 B.C. Thus the year 1921 A.D. is innus Munds 1988-2 in the Jowish Calendar. A calendar for 368z-368s will be found opposite.

Julian Persod.—"A period of 7980 Julian years, proposed by Joseph Scaliger in 1982 as a universal standard of comparison of chronology, consisting

of the product of the number of years in the solar and lunar cycles and the cycle of the indiction (as x a x x s). — New Bngtish Dictionary.

Maccolorism.—The epoch was the occupation of Babylon by Selencus Nicator in gar B.C., and this system of chronology prevailed in all Greek countries until the Middle Ages, and was adopted by the Jews until the fifteenth century. It is extent among certain nomadic 4 arch tribus. extant among certain nomadic Arab tribes.

Muhammadan.—The Muhammadan Epoch is the Hejira, or Flight of Mahomet, from Mecca to Medina in 62s A.D. The first day of the first month of the Muhammadan Era corresponds to 18th July, 622 A.D. The year 1921 is therefore 1339-1340 of the Hejira, a calendar for which year will be found on p 100.

Olympiads. -- Greek chronology was reckoned in cycles of four years corresponding with the m cycles or rout years corresponding with the periodic Olympic Games held on the plain of Olympia, in Elis, once in four years; the intervening years being the first, second, &c., of the Olympiad, which received the name of the victor at the Games. The first recorded Olympiad is that of Choroebus, 776 B.C.

Persian.—The chronology of Persia, which is still followed by the Parsees of India, dates from the accession of Yazdegerd III. to the throne on zeth June, 63s A D. The year zest is, therefore, zee of the Parsees. The New Year begins on

aust March.

Roman. - Roman historians adopted as an epoch the Foundation of Rome, which they signified by the abbreviation A.U.C., Ab (anno) Urbis Conditæ (From the year of the founded city) This epoch is believed to fall in the year 753 B.C. The Calcular as we know it was a Roman institution; it was revised and remained unchanged in Western Europe until the year introduced in the particular year. If a Sunday the letter is a Sunday the letter is the letter is of that of every four years three were Common from March z-Dec. 32.

Fours of 35g days and the fourth a Leap Fear of 366 days. But this system made the civil year longer than the astronomical year, the difference being 2 days in 400 years, so that in the year 1752 A.D. there was an error of 11 days. Under rygs A.D. there was an error of ix days. Unuer the reformed soheme 2 leap years are omitted in each 400 years, and the years 1800 and 1900 each consisted of 365 days only. The year seco will be a leap year, the next subsequent end-century leap year being 2400.

### CHRONOLOGICAL TERMS ELPLAINED.

Golden Number, so called from its importance in calculating the date of Easter, is the number of any year in a lunar cycle of nineteen years. It contains (approximately) 245 lunations, in which period the Moon retzrus to the same apparent position with regard to the Sun, so that new and full Moons occur at the same dates in the corresponding year of each cycle.

Easter Day is the first Sunday after the Paschal Full Moon (i.e., the full moon which happens upon, or next after, March as; if that full moon occurs on a Sunday, Easter Day is the Sunday after).

Epact.—The age of the Moon at the commencement of the year, thus indicating the difference between the solar and lunar cycles.

Solar Cycle.-A period of twenty-eight years in any corresponding year of which the days of the week recur on the same days of the month.

Roman Indiction. - A period of fifteen years, instituted by the Emperor Constantine in A.D. 313 for fiscal purposes.

The Dominical Letter is one of the first seven letters of the alphabet, A-G, which are used in succession to denote the Sunda's (Lord's Day) in a particular year. If the first day of the year is a Sunday the letter is A; if the second, B; the third, C; and so on. Lesp year requires two letters, the first for Jan. r-Feb. 29, the second

## JEWISH CALENDAR.

and in alignment with 5z we find "F," which is the Dominical Letter for 175z, Old Style, and the Calendar for that year is Table F. (s) Find the Calendar for 1814:—Under 19, New Style, and in line with 24 we find "D." Therefore Table D is the Calendar required. (3) Find the Calendar for 1825:—This is a Leap Year, and has two Dominical Letters. Under 19, New Style, and in line with 26 we find "DC." Use Table D from Jan. 1 to Feb. 29, and Table C from March 1 to Dec. 21.

HOTE,—Old Style changed to New Style Sept. 24, 2722. For 1752 use Table E from Jan. 1 to Feb. 20, Table D from March 1 to Sept. 2 (12 days omitted), and Table A from Sept. 14 to Dec. 21.

This Calendar, arranged by Mr. John C. Robertson, of Kirkcaldy, Scotland, is copyright.

	DE CEPTION,	etransen of mir.	DOME C. MODELLES	son, of Kirkcaldy, Scotland, is copurett.

## Astronomical Glossary.

bodies appear to be affixed to the inner surface of a sphere of which the observer is the centre, and this colertial sphere is supposed to be marked with merthans and parallel circles just as is the terrestrial globs. The central of these as is the terrestrial globe. The central of these chicles is the extension of the Earth's Equator. On the celestial sphere Right Ascension is the counterpart of longitude on the Earth. Declination is the counterpart of terrestrial latitude.

The Elliptic.—The extension of the plane of the Ecliptic (see p. 99) marks a circle round the celestial sphere called the Ecliptic The position of the Ecliptic in the sky may be traced approxi-mately by the positions of the moon and planets which always lie near it. The Sun is always

in the Brliptic.

The First Point of Aries.—The Reliptic and Equator intersect in two points, the Sun being at one of these at the Spring Equinox. This point is called the First Point of Aries, and this is taken as the zero point from which Right

Ascension is measured.

A similar system of circles parallel to the Ecliptic, with meridians at right-angles to them, is imagined, and the position of a heavenly body with reference to these is called its celestial latitude and longitude Celestial longitude is also measured from the First Point of Arles, and does not differ greatly in amount from Right Ascension.
The R A. and Dec of a Star, except for changes

mentioned on p 83, are constant. The R.A. and Dec. of a Planet change because of the movement of the Earth and Planet round the Sun. The Right Ascension of the Sun continually increases because of the Earth's movement.

Opposition - Since the Earth and planets move round the bun at different rates the Earth will ! at certain times pass between the Sun and an exterior planet, and the latter is then said to be in Opposition. The longitude of the planet measured from the Earth differs then from that

Right Ascension, Declination.—The heavenly of the Sun by 180°, and the planet is in the South at midnight.

Connenction. - When the Earth and an Exterior Planet are in line with the Sun, the latter being between the two other bodies, the Planet is in Conjunction, and the Sun and the Planet have the same longitude. For Mercury and Venus, this configuration is called Superior Conjuction. When either of these planets is in line with the Sun and Earth and between these two hodies, it is said to be in Inferior Conjunction. A planet in either kind of Conjunction has the same lougitude as the Sun, and therefore approximately the same Right Ascension.

In the course of its movement round the Earth, the Moon in every month is brought in line with each of the planets in turn; or it sometimes happens that two of the planets are brought by their orbital motion into line with the Earth (or nearly so). In such cases the two objects are seen near together in the sky, and are then said to be in Conjunction. Technically, the word is here used in a somewhat different sense from that of the preceding paragraph, the definition being that the two objects are in conjunction when they have the same Right Ascension.

Elongation of Mercury and Venus (see p. 85) Stationary Points - A line being supposed joining the Earth and a planet, at certain epochs on either side of Opposition, or of Inferior Conjunction in the case of Mercury and Venus, this line remains parallel to itself for some days, and the planet does not change its position among

Heliocentric Position -For some purposes it is convenient to consider the position of a celestial body supposed to be seen from the centre of the Sun In this convention the position is given in latitude and longitude, but the longitude is not the same in amount as that referred to in the preceding paragraphs.

Occultations (see p. 50).

#### ROMAN CALENDAR

In the ancient Roman (Julian) Calendar the days of the mouth were not counted onward from the beginning, as with us, but three fixed points were taken, and any particular day was said to be so many days before the next coming fixed day. These three points were (x) the kalends, by which name the first of each month was known; (a) the Nones, which tell on the seventh day of the month in March, May, July and October, and on the fifth day in each of the other months; and the Ides, which always tell eight days after the Nones. The first day of a month being called its "Kalends" the last day of the preceding month is called the day before the Kalends (pridie Kalendas). Thus December 32 would have been written "pridie Kal Jan." The day before that, Decemtaken in the reckoning, and so on back to the Ides, and from thence again to the Nones.

### THE COPTIC CALENDAR

Year 1637. A D. 1981.	Year 1637 A D. 1981.
Tubah Jan.	MasriAugust 7
	Intercalaty Sopt. 6-10
	Year 1638.
	1útSept. 11
Bashuns May	BabahOct. zz Hatur Nov. zo
Bunah June 👂	Hatur Nov. zo
AbibJuly 8	Kihak Dec. zo

In the Coptic Calendar, used by part of the population of Egypt and Ethiopia, the year is composed of za months of 30 days each, followed "pridle Kal Jan," The day before that, December 30, is the third day of the Kalends, both the ber 30, is the third day of the Kalends, both the beginning and ending days of the interval being Calendar is that of Dioeletian, A.D. 384.

THE shape of our Earth is that of an oblate, spheroid, or a solid of revolution whose meridian sections are cilipses not differing much from circles, whilst the sections at right angles to these are circles The length of the Polar axis, according to a recently accepted determination (Hayford) is 7,900 o miles and the diameter of the Equatorial circle 7,926 7 miles. The suggestion has been made that the Equator is not an exact circle, but the supposed deviation from circularity was small, and the fact has not been proved The mean density of the Earth is 5 5 times that of water. The Earth moves round the san in a plane which passes through the sun's centre, or, to write with more precision, the centre of gravity of the Sun and Moon moves in this plane, and the Earth revolves round this centre not remaining precisely in the plane The plane is called the plane of the Echptic. The Earth's Equator is inclined to this plane at an angle of \$3\frac{1}{2}\, and it is this tilt which causes the Seasons, for the inclination is always in the same direction, and is such that the Northern end of the axis about which the Earth rotates points towards the Sun in the Summer of the Northern hemisphere, and away from it in the Winter. The Sun and Earth are surrounded on all sides by the stars, and because the Earth moves round the Sun, the Sun appears to change its position with respect to the stars during the year, and different sets of stars are seen in the sky at midnight in Summer and Winter, the Sun being between the Earth and the Winter stars in summer and ruce-versa. Because of the inclination of the Equator to the Ecliptic, the Sun is high in the sky in Summer and low in Winter. The dates when the Sun is at the exact mean or intermediate positionsie, when it is at the points in the sky defined by the line of intersection of the planes of the Equator and Ecliptic—are called the Equinoxes, and on these dates day and night are of equal duration all over the globe. The average velocity of the Earth in its orbit is 181/2 miles a second, and it moves more slowly in July than in January. It makes a complete rotation on its axis in about 23 hours 56 minutes of mean time. Because the Earth moves round the Sun in the same direction as it rotates on its axis, the length of a solar day is more than the length of a rotation by about four minutes (see p. os) It has been shown almost conclusively in recent ears that the axis of rotation is not a fixed line in the Earth, but that its extremity circles about the pole of figure at a distance of a few feet.

## THE TIDES

The Tides of the Ocean are rightly attributed to the attractive influence of the Moon on the Oceans, modified by a similar influence of the Sun but of less amount because of the much greater distance of the attracting body. If the Earth were a globe uniformly covered with water it might be possible to account for the observed phenomens and predict them by simple mathematical consideration of these attractive influences, but these are very greatly modified by the land formations of our globe, and the prediction of the ides for any port depends mannly on the results of observation. A series of observed times and heights of the tide having been compiled and analysed, the analysis will show that the complete tidal movement can be represented by the combination of a series of periodic terms, and when these terms

are each carried forward to some future date their recombination gives the predicted tide. The mean level of the sea remains practically constant, but small changes have been detected which may be assigned to various causes. Taking the mean sea-level as datum, high water is at its lughest (springs) at or near New and Full Moon, whilst low water falls an equal amount below at those times. At or near the time of the first and last quarters of the Moon (neaps) the high water level as it does at aprings, and the low water rises only about half as much above the mean phenomena do not usually coincide exactly with the times of these phases of the Moon, but occur later, the interval being known as the age of the tide—thus, at London Bridge, the highest or spring tide occurs 2½ days after New or Full Moon, and the neap tide is similarly delayed The difference of height of spring and neap tides is the most apparent of the periodic differences which make up the whole tidal variation. Besides this there are differences due to the varying distance of the Moon from the Earth, and when the Moon is at or near perigee at New or Full the tide is specially high. There is a slight difference in the heights of the spring tide at New and Full Moon, and also in the height of the neap tide at the respective quarters, but these and other small periodicities are not appreciably noticeable at some ports.

## TERRESTRIAL MAGNETISM.

A phenomenon of the Earth, the origin of which is obscure, but on which some light has been thrown by recent investigations, is known as Earth magnetism Its best known manifestation is its effect on the needle of a mariner's compass. which, except for the variations to be immediately described, points continually northward. The north point indicated by a compass needle. except in particular cases, is not the north point shown by astronomical observations; in other words, the needle does not point to the North Pole of the axis of rotation of the Earth, but makes an angle with the terrestrial meridian. This angle is called the Magnetic Variation, or, more generally, Magnetic Declination, and differs in different parts of the world and even over limited tracts of country. Along a line from the north of Norfolk through Greenwich to Chichester the declination is the same as at Greenwich. Along a parallel line through Dover the West declination is at present about a degree less; from Newcastle to Plymouth it is about 1½° greater; whilst at Dublin the declina-tion West is 3° or 4° greater than at Greenwich. Observations of magnetic declination are made and charted to show the amount of this magnetic element over our globe, and from such charts it appears that there are two points or regions which may be considered as directive centres, and which has be considered as a first arc known as the Magnetic Poles. At these places a freely suspended magnetised needle would stand vertically. They do not coincide with the terrestrial Poles, nor are they exactly antipodal. The position of the North Magnetic Pole is about latitude 73°, longitude 20° W.; the South is in latitude 72°, longitude 25° E., but these positions apparently undergo secular change. The magnetic declination at any place changes gradually year by year, and its amount observed in or near London at certain epochs is given in the table on p. res. That the compass needle does not in general point true north and south,

hut that it is inclined a certain amount east or west, and that the amount varies with the locality was recognised among western nations by the end of the 15th century, Columbus being credited with the discovery. That there is a secular change in the magnetic declination, or that the amount at any place changes slowly year by year, was discovered by Gellibrand in 1624.

Magnetic Declination at London.

2580				East.
			30	West.
				West.
1800	 	24	0	West.

In 1829 the westerly declination at Greenwich was about 24° 25', which was probably its maximum Since then it has been moving slowly eastward. The following table of mean magnetic elements is derived from the observations made at Greenwich in the respective years, and applies to Greenwich only. The figures for 1220 are approximate.

Year.	Mean Magnetic	Horizontal Mag	Mean Inclina-
	Declination at	notic Force in	tion or Dip of
	Greenwich	C G S Units at	Nordle at
	West	Groenwich	Greenwich
1900 1910 1915 1916 1917 1918 1919	16 29 0 15 41 2 14 56 5 14 46 9 14 37 0 14 27 7 14 18 8	'1846 '1855 1851 '1849 '1848 '1846 '1845 '1844	67 8 5 66 52 6 66 51 8 66 53 8 66 53 7 66 54's 66 53'6 66 54

The dip is the angle that a delicately poised needle constrained to move in a vertical plane under the action of magnetism only will make with the horizontal plane.

The declination varies during the at hours, for the needle makes a small excursion in the morning from East to West, and returns, the range at Greenwich being about za' in summer and 7' in winter. The needle occupies its mean position in the morning about roh, and again about 18h, throughout the year. It reaches its most westerly position about 14h., and its most easterly position during the night or early morning according to season of the year. The inclination or dip also varies in a similar manner to the declination. Since these variations of the magnetic elements are mainly confined to the hours of daylight, are much greater in summer than in winter, and are evidently affected by changes in the solar activity-for the variation is larger at times of Sun-spot maximum than at minimum—it may be concluded that they are in some way dependent on solar radiation, and it is suggested that the ionisation of the upper atmosphere by the Sun, which causes it to be highly conducting, may produce the effect.

#### MAGNETIC STORMS.

Besides these diurnal movements and their periodic variations, the magnets recording the three elements sometimes make sudden and violent oscillations which may continue for several hours. Such an occurrence is known as a Magnetic Storm, and is accompanied by spoutaneous electric earth-currents, which, if unusually violent, cause hindrance to the working of osble and telegraph systems. These storms

begin suddenly, and practically simultaneously all over the Earth. The occurrence of a magnetic storm on March 28, 1920, which lasted for several days, at a time when a long train of spots was crossing the Sun's visible disc, helps to make plausible the hypothesis that these storms are caused by the direct artion of streams of electrified particles driven into space by solar action (see p 27). But the theory has not passed without criticism, and is not finally accepted Dates of previous magnetic storms of some violence are. Angust 21, 1925, 1925, 1920, Oct 31, 1923; Nov 27, 1882.

#### GRAVITY.

The law of attraction of universal gravitation affirms that two bodies exert on one another an attraction directly proportional to their masses and in inverse ratio to the square of the distance between them, and since this is so the terrestrial mass exerts an attraction upon all the bidles at its surface. The combination of this attraction with the (so-called) centrifugal force due to the rotation of the earth produces a resultant force which is known as gravity. The direction of this force is the vertical.

It is found by experiment that the force of gravity (generally indicated by the letter g) adfiferent in different istitudes. At the Pole the force exceeds that at the Equator by rather more than a two-hundredth part, or, in other words, a person who weight soo lbs at the Equator by a spring balance would weigh by the same balance sor lbs at the Pole.

The experiments consist in finding the time of oscillation of the same pendulum in different latitudes, the time being smaller as g is larger A pendulum which makes a swing in exactly one second is longer at places where g is large.

The following table gives the relative values of the force of gravity and the length of the seconds pendulum at various places—g is the acceleration due to gravity in centimetres.

	g	l.
Equator	978 05	99 997
Latitude 45° .	980 63	99 359
Greenwich	g8x ax	99 418
Ediuburgh	6gz . eo	99.457
Pole	983 23	99 6aa

#### EARTHQUAKES

Earthquakes, or earth tremors, are believed to be due to some form of fracture caused by the breakage of the Earth's substance under a growing strain, when the strain has passed the breaking point. This gives rise to waves which are propagated through the solid substance to distant parts of the Earth, and vertically upwards to the surface, sometimes with disastrous effects. The point where the fracture occurs and the earthquake originates is called the seismic centre, or origin, or focus. That part of the Earth which is vertically above this centre is called the epicentre. The waves transmitted through the Earth may come to the surface hundreds, or even thousands, of miles from the epicentre, and the times of arrival are recorded The first indications on the seismograph are made by longitudinal waves (P), which are right by longitudinal waves (r), which are followed after an interval by direct transverse waves (S) in approximately the same path. From the length of the interval between the appearance of the P and the S waves the distance of the earthquake is inferred.

## The Motld."

THE Superficial Area of the Earth is estimated to be 196,550,000 square miles, of which 55,500,000 square miles are Land and 141,050,000 square miles Water. The Diameter of the Earth at the Equator is 7.926\(\frac{1}{2}\) English miles, and at the Poles 7,900 English miles. The Equatorial Circumference is 24,872'4 English miles, divided into 360 Degrees of Longitude, each of 69 00 English (or 60 Geographical) miles; these Degrees are measured from the Meridian of Greenwich, and numbered East and West of that point to meet in the Antipodes at the 180th Degree. Distance North and South of the Equator is marked by Parallels of Latitude, which proceed from zero (at the Equator) to 90° at the Poles.

#### AREA AND POPULATION.

Continent	Area in Square Miles	Estimated Population
Kurope	3,750,000 17,000,000 17,500,000 8,000,000 6,800,000 3,450,000 5,000,000	400,000,000 920,000,000 180,000,000 180,000,000 38,000,000
	55,500,000	1,646,000,000
	1	1

The British Empire extends over the largest area (14,220,000 sq. miles); Russia is the second largest country (8,400,000 sq. miles); France is third, with 4,336,000 sq. miles; China extends over 4,300,000 sq miles, the United States, with its Insular Jurisdiction, &c , covers 3,750,000 sq. miles, and Lrazil 3,220,000 sq miles.

#### THE RACES OF MANKIND.+

The Races of Mankind are divisible according to Stock or, less scientifically, according to Colour The Dominant Colour is Yellow—the numerical order being (1) Yellow, (2) White, (3) Black, (4) Brown, (5) Red. The main Divisions of the Races are as follows:—

Division	Area.	Estimated Number.
Mongolian (Taucasian Negro Seinitic Malayan Red Indian	Asia Europe & Orient Africa North Africa Australana America	655,000,000 645,000,000 190,000,000 81,000,000 58,000,000 83,000,000

The Earth is a Sphere, with a Northern and Southern Hernuphere; the Ocean surface is called the Hydrosphere, and the gaseous envelope the Almosphere. The arbone concerned with the study of the Earth's crust is concerned with the study of the Earth's crust is the surface of the Surface of Southern the Surface of Southern the Surface of Southern the Surface of Southern the Surface of

18 about 00,000 miles an near 1900,000 for the farth can maintain it is that been estimated that the Earth can maintain a population of 6,000,000,000 a total which will be reached about a p. 2200, at the present rate of increase.

#### THE LARGEST CITIES.

The following cities have a population exceeding half a million :-

nan a minion:-	
LONDON (Greater), England (1918)	7,432,929
New York (Greater), U.S.A. (1919)	6,141,445

Special Trans includes Imports retained for Home Consumption and Exports of Domestic Produce or Manufacture, and excludes Imports that are re-exported.

† Greeks Trans includes the total value of Imports and the total value of Exports, and the combined total under these two headings is given where the value of the Special Trade cannot be definitely ascertained.

§ Montenger and Serbia are included in Yugo-Slavia.

† Particulars for Secust Eussia.

### The League of Mations.

One of the results of the War of 1914-1918 was the formation of a League of Nations, with a Covenant, and a charter of XXVI Articles. The principle underlying the formation of the League was adopted by the delegates to the Peace Congress at Versailles on Jan 25, 1919, and its influence was shown in the terms of the Treaties.

The High Contracting Parties agreed to the Covenant in order to promote International Co-operation and to achieve International Peace and Security, by the acceptance of obliga-

tions not to resort to War

"by the prescription of open, just and honourable relations between Nations;

by the firm establishment of the understandings of International Law as the actual rule of conduct among Governments;

and by the maintenance of justice and a scrupulous regard for all Treaty Obligations in the dealings of Organized Peoples with one

another

The territonal integrity and existing political independence of all members of the League is guaranteed by the League In case of any dispute between members, likely to lead to a rupture, they will submit the matter to arbitration or enquity, and agree not resort to war until three months after the award by the arbitrator or the report by the Council, such award to be made within a reasonable time, and such report to be made within as months of the submission of the matter in dispute. Any member resorting to war in disregard of these rules shall be deemed to have committed an act of war against all the remaining members of the League, who undertake to subject the aggressor to the severance of all intercourse and trade or financial relations, while the Council of the League shall recommend to the Governments concerned what effective force—shall be contributed by each to protect the covenants of the League

In the event of a dispute between a member of the League and a State which is not a member (or between States that are not members) invitation shall be made to the State or States that are not members to accept membership, with its privileges and obligations. If the invitation be refused, and the State that is not a member resort to war against a member of the League, such State shall be deemed to have made war or every member of the League and shall be so dealt with If the invitation be refused by States that are not members, the Council shall take such steps as may be possible to svert

hostilities and to settle the dispute

Article XXIII provides for securing fair and humane conditions of labour for men, women and children in the countries of members, and in those in which members have commercial and industrial relations, and provides for the just treatment of natives, for the suppression of the "White slave traffic;" for the suppression of the traffic in optum and dangerous drugs, and in arms and ammunition; for the freedom of communications and trade between members, and for the prevention and control of disease.

The formation of the League was very largely the work of Woodtow Wilson, President of the Inited States of America 1913-28, but his action in committing the United States to participation in the League was repudiated by the longia Relations (ommittee of the Senate of the U.S. and was not endorsed by the electors in the Presidential Election of 2020.

The Council of the League consists of representatives of the British Empire, France, Italy and Japan, together with representatives of four other members of the League selected by the Assembly of Representatives of the members of the League. Any member of the League not represented on the Council shall be invited to send a representative to sit as a member of the Council during the consideration of matters specially affecting the interests of that member of the League.

The original members of the League were the Signatories of the Treaty of Peace at Versailles on behalf of the Allies, June 38, 1919;—

Belgium Haiti Bolivia Hejaz Brazil Honduras British Empire Italy Canada Japan Australia Liberia South Africa Nicaiagua New Zealand Panama India Peru China Poland Cuba Portugal Czecho Slovakia Rumania Ecuador Siam France \*United States Greece Uruguay Yugo-Slavia Guatemala

The following States were invited to enter:-

Argentina Persia Salvador Colombia †Spain †Sweden †Netherlands †Switzerland †Norway Venezuela

Any fully self-governing State, Dominion or Colony, not named as an Original Member, may become a member of the League if its admission is agreed to by two-thirds of the Assembly.

Any member of the League may, after two years notice of its intention to do so, withdraw from the League, provided that all its international obligations, and all its obligations under the Covenant, shall have been fulfilled at the time of its withdrawal.

SEAT OF THE LEAGUE, Geneva, Switzerland.
OFFICERS OF THE LEAGUE.

President (1921), M. Paul Hymans.

Secretary-General, Hon Sir Eric Drummond, K.C.M.G., C.B. (and allowance £ 500) . £5,000 Organizing Secretary, Raymond B. Fosdick. Financial Director, Sir Heibert B. Ames, Li.D. High Commissioner for the Feeding of Europe,

Herbert C. Hoover. Director, Labour Section, Prof. Louis Varlez,

Director, Labour Section, Prof. Louis Varies London Office, 117, Piccadilly, W.z.

LEAGUE OF NATIONS UNION, 25, Grosvenor Crescent, S.W. 1.—President, Viscount Grey of Fallodon, R.G.; General Sec., J. C. Maxwell Garnett.

\* The U S Senate has declined to participate in the League † Has since jouned the League.

8,000	Duchess of Albany	6,000
	Princess Beatrice	6.000
£470,000	King Edward VII.'s Daughters	18,000

⊋ueen Alexandra

### The Peerage of the United Ringdom.

In a broad sense this heading is commonly taken as identical with that of the House of Lords. It a broad sense this nesating is commonly taken as identical with that of the-fiouse of Lords, although there are close upon 130 holders of titles of long-standing nobility who are not members of the Upper House of Parliament, their peerages being those of Scotland or Ireland only. But there are about an equal number of Feers of those kingdoms who possess additional titles which constitute them members of the House of Lords, these titles being in a majority of instances, though very far from all, inferior to those by which they are generally known. The full details as to each are given under his leading title, and a reference is in every case supplied under the the may hold, so that the table of squivalent title formally given in this most in any other that he may hold, so that the table of equivalent titles formerly given in this work is no longer needed a double index will be found in "WHITAKER'S PEERAGE, BARONETAGE, KNIGHTAGE AND COMPANIONAGE"

Contractions.—S or I. appended to the date of creation denotes a Scottish or Irish title; the further addition of a "implies that the Peer in question holds also an Imperial title, which is specified (after the name) by its more definite description as Engl., Brit. or U.K. When both titles are alike, as in the case of Argyll, this star is appended to the conjoined date below, and it then denotes that such date is that of the Imperial creation. A  $\dagger$  appended to S, or I, implies that the Peer is an elected Representative to the House of Lords For the mark  $^\circ$  see heading to Marquesses: b, signifies born, s., succeeded; m., marned; w., widower or widow; divorced.

M , miuoi

Order Commanders of the British Empire Companions of the Distinguished Service Order Members 4th Class of the Royal Victorian Order

Officers of the British Empire Companions of the Imperial Service Order

Eldest Sons of younger Sons of Peers Baronete's eldest Sons. Eldest Sons of Knights in order of their Fathers.

Members 5th Class of the Royal Victorian Order Members of the British Empire. Younger Sons of the younger Sons of Peers.

Younger Sons of the younger Sons of Peers.

Baronets youngar Sons.
Younger Sons of Knights in the same rorder as their Fathers.
Naval, Military, and other Esquires by Office
Women take the same rank as their husbands or as their eldest brothers; but the daughter of a Peer marrying a Commoner retains her title as Lady or Honourable Daughters of Peers rank next immediately after the wives of their elder brothers, and before their younger brothers wives Daughters of Peers marrying Peers of lower degree take the same order of lower degree take the same order of lower degree take the same order of laroness only, while her sisters married to commoners retain their rank ried to commoners retain their rank and take precedence of the Baroness Merely official rank on the husband's part does not give any similar pre-cedence to the wife \*

There are three Orders confined to Ladies: The Order of Victoria and Albert, the Crown of India, and the Albert, the Crown of India, and the Royal Red Cross, but members are entitled to no special precedence. The Order of the Bruins Empire is one to Ladies, the two highest classes being styled Dames Grand Cross and Dunes Commanders.

Local Percenter — No written code of county or city order of pre-cedence has been promulgated, but naturally in the county the Lord Lieutenant stands first, and secondly the Sheriff. In London and other corpurations, the Mayor stands first. Where of the Company

For fuller tables (and for Scottish and Irush Precedency) see Introduction to "Whiteres's Presents Execution and Companionape," a companion volume, price and not.

## Unights Bachelor.

The Knights Bachelor do not constitute a Royal Order, but comprise the surviving representation of the ancient State Orders of Knighthood. The Register of Knights Hachelor, instituted by James I in the ryth century, lapsed, and in 1908 a voluntary association under the title of "The Society of Knights (now "The Imperial Society of Knights Bachelor" by Royal command) was formed with the primary objects of continuing the various registers dating from 1897 and obtaining the uniform registers of the registery created Knight. An annual Knightage is published from information supplied by the authorities, and can be obtained on application The Officers of the Society are:—Principal, Sir Henry Pellatt, Kt., vo., inc.Prenderd, Sir William Bull, Kt., xr.; Hon. Registrar, Sir Harry Noth; Clerk, H. Whelbourn; Registry and Library, a Mitre Court, Temple, E.C. 4.

A LIST OF THE GENTLEMEN WHO HAVE RECEIVED THE HONOUR OF KNIGHTHOOD. (Exclusive of such as have afterwards received the higher honour of E.C.B., etc., q.v.)

The Distinguished Service Cross.—2914.—1) S.C.—In substitution for the Completions Service Cross, 2921, is designed for bestowal on all officers of the R.N. below the rank of Lieutenant Commander

The Military Cross, ... 1915 - W. C.-Awarded to Cap tains, Lieutenants and 1st class Warrant Officers in the Army and Indian and Colonial Forces

The Distinguished Flying Cross - 1918-D F C -De signed for bestowal upon officers in the Royal Air Force for acts of gallantry when flying in active operations against the enemy

The Air Force Cross 1918 - A F C -Instituted as preceding but for acts of courage or devotion to duty when flying, although not in active operations against the enemy

The Military Medal. 1916 - M M - Awarded to noncommissioned offices and men for individual or asso-ciated acts of bravery in the Field. In exceptional circumstances the Medal may be awarded to women of all nations

The Distinguished Service Medal - 1914 - 19.8, M - Is designated for chief petty officers, petty officers, men, and boys of all branches of the R N, to non commissioned officers and men of the R N A, and to all other persons holding corresponding positions in His Majosty a Bervice adost, for distinguished conduct

The Distinguished 'lying Medal - 1918—D F.M —and the Air Porce Medal, for warrant and non-commissioned officers and nem for equivalent services as for D F C and A.F.C

The Conspicuous Galantry Medal. — CG M. — bestoned upon warrant officers and men of the R N.

The Distinguished Conduct Medal.—D.C.M.—Awarded to warrant officers, non commissioned officers, and men of the Army

The Volunteer Officers' Deceration — V D.—Was an honour for rewarding the mentorious services of officers of the toroc in question, who must have been in commission and have served twenty years

The Territorial Decoration—T D—Established in 1908, is restricted to commissioned officers of twenty vers good service in the Territorial Force, and not holders of the Volunteer Decoration—Similarly a Territorial Long Service Medal has been substituted for that formerly awarded to Volunteers

The Royal Red Cross—R R C —For ladies founded 1883, is a distinction conferred upon ladies of any rank or mation who may be brought to the Novereigns butter for acts of mency in attending to the sick or wounded in time of war.

The Order of Mercy.—Roth sexes; was established in right in cuntration with the Learne of Mercy, an institution also founded in 1899 to promote the welfare of hospitals in obtaining small subscriptions for King Edwards Hospital Fund for London, &c

The Indian Order of Merit.—Instituted in 1839, as a reward for personal bravery, to Indian officers and men.

The Kaiser-i-Hind Medal.—Was founded in 1900, and is a reward for any person, of either sex, who shall have rendered usoful service in or for India.

The Albert Medal.—Dates from 1866, with extensions in 1867 and 1877 and is a recognition of acts of gallantry performed by any person whatever—"For Gallantry in Raving Life at Sea" or "on Land."

THE third Parliament of King George V. was elected in December, 1918, and met on February 4, 1919. The General Election had returned 478 supporters of the Coalition (334 Unionists; 133 Lilberals; 2x Labour) and 229 Non-Condition (63 Labour; 48 Unionists; 28 Liberals; 73 Sinn Feiners; 7 Nationalists; and 10 Independents), distributed as shown in the following table:—

	DISTRIBUTION OF MEMBERS			PARTY STRENGTH (Jun , 2929).			
	Counties.	Boroughs.	Univer-	Total Members	Coalition	Non- Coalition,	Majority.
England	230 24 38 80	255 11 33 21	7 I 3 4	492 36 74 105	401 81 56	91 15 18 105	320 Coahtion. 6 Coalition. 38 Coalition. 105 Non-Co.
United Kingdom	372	320	15	707	478	229	249 Coalition.

Only successful candidates who received the recognition of the Prime Minister and Mr. Bonar Law are included among the supporters of the Coalition. Thus, the Irish Unionists are omitted from the Ministerialists, although, like many other Non-Coalition members, they are in general agreement with the Government.

#### ALPHABETICAL LIST OF MEMBERS OF PARLIAMENT.

The following list gives Surname, Initials, Politics, Key Number of Seat on pp. 217-230, Name of Division, and Majority at Last Election of each of the 707 Members of Parliament.

Co. U. = Coalition Unionist, Co L = Coalition Liberal, Co Lab. = Coalition Labour;  $U_{\bullet} = \text{Unionist}$ ; L = Liberal, Lab = Labour, Ind. = Independent; NP = Nationalist Party; N, D, P = National Democratic Party, N = Nationalist, <math>S, F = Sinn Fein

N.D. I - Hatkilla Delinerate laity	n nationalist, nr = Simi Fein.

SESSION 1919.

THE ALIENS BILL.-The first measure considered after the recess was the Aliens Restriction Bill, which had been extended in scope esage through the Standing Committee. Oct as the Home Secretary sought to qualify the provision that "no alien shall hold a pilotage certificate for any port in the United Kingdom by excepting a handful of French pilots whose certificates had been guaranteed some years earlier by an agreement with France. The amendment was defeated by 185 to 113, and Mr Bonar Law at once moved the adjournment to enable the Government to decide on their action. After a consultation during the succeeding week-end with the anti-alien leaders, Mr. Bonar Law asked the House on Oct. sy to accept an amendment safeguarding the existing French interests, but excluding all other foreign pilots from British ports. This settlement was accepted. On Nov. 4, on a free vote, an amendment to Clause a was carried by ment to Clause 9 was carried by as6 to x16, providing that every former enemy alien in the United Kingdom should be deported forthwith unless the Home Secretary granted a licence to remain, those given exemption from internment or repatriation by the Advisory Committee during the war being excepted. A new clause, added on Nov. 13, made it unlawful for three years from the passing of the Bill for a former enemy alien to acquire any land or interest in land or industry in the United Kingdom. The Bill was read a third time on Nov. 18. The Lords made several amendments in Committee on Dec 9. On the motion of Lord Newton, the Upper Chamber agreed that former enemy aliens need not be deported if the Advisory Committee recommended the Home Secretary to grant a licence to remain. Another amendment added permitted a former enemy alien to land if he were provided with a passport issued by a com-petent authority of his own country and hearing the visa of a British Consul. On the report stage, on Dec. 15, an amendment was adopted that the permission to land should be given only on special grounds. The Commons, by 128 to 66, disagreed with the Lords' amendment to (lause 9 on Dec. 17, but the Peers insisted, and the other House eventually decided to accept rather than lose the whole Bill, which received the Royal Assent on Dec. 23, when Parliament was prorogued.

THE IRISH PROBLEM.—Just before the Session ended, the Prime Minister, on Dec. 22, outlined the Cabinet's proposals for Irish self-government. Mr. Lloyd George referred to the outburst of crime in Ireland, and remarked that three-fourths of the population were hostile to British government. He declared that North-East Ulster had as rightful a claim to autonomy as the rest of Ireland, and as emphatically repudiated the Sinn Fein demand for separation. Under the Bill which would be introduced two self-governing Parliaments would be established—one for Prucestant North-East Ulster at Belfast, and the other for the rest of Ireland at Dublin A Federal Council of forty members, elected in equal parts by the two Legislatures, would form a connecting link, and would have full responsibility for private bill legislation for the whole of Ireland at the outset, and any other powers delegated to it by the two provincial Parliaments. The latter would have full legislative

powers over all subjects not expressly reserved to the Imperial Parliament at Westminster, where a Irish representatives would sit. They would also possess full constituent powers for the creation of a single Irish Legislature, but action to this end must rest with them and not with the Imperial Parliament. Until there was a single Parliament, the postal services would not be transferred, while Customs, excise, income-tax, and excess profits would also be reserved, though each Parliament would have the same powers over taxation as were possessed by State Legislatures in the United States. A free grant of £1,000,000 would be made to each Parliament to cover initial expenditure, as well as a permanent free grant of the existing annuities. Ireland's actual contribution to Imperial services would, after two years, be settled by a Joint Exchequer Board. The Prime Minister said the proposals would be embodied in a Bill and submitted at the earliest available opportunity. The world would know, he declared in conclusion, that Britain entered upon the task prompted only by that deep sense of justice and right which had sustained the nation during years of suffering.

INDUSTRIAL COURTS -A serious attempt to prevent and settle trade disputes was made by the Industrial Courts Bill, which was presented by Sir Robert Horne on Nov. 3. The measure provided that existing or apprehended disputes reported to the Minister of Labour should be referred for settlement to a standing Industrial Court or a Court of Enquiry appointed by the Court or a Court of andury appointed by the Minister, and consisting of representatives of employers and workmen and independent persons. The provision of the Wages (Temporary Regulation) Act, rsps, were also extended until Sept. 30, rspsc. During the third reading debate on Nov. 27, Mr. Hendersen said the Bill, however useful it might be, provided no remedy for the more permanent, savects of industrial for the more permanent aspects of industrial unrest. Both the Government and the em-ployers, he said, must realise the pressing need Both the Government and the emfor a comprehensive economic and industrial programme, which the Labour Party considered absolutely essential if they were to secure the permanent removal of widespread industrial unrest. The liouse of Lords passed the Bill on Nov. so.

THE GOVERNMENT OF INDIA. — After being considered by a Joint Committe of the two Houses, the Government of India Bill, designed to carry out the proposals of the Viceroy and the Secretary of State for the realisation of responsible government in India, was returned to the House of Commons on Dec. 2, and two days later received its third reading. Mr. Montsgu, who was congratulated by Sir Donald Maclean and Mr. Adamson, said although there were great dangers and anxieties, he was certain that there was no better way of consolidating the British Empire than by initiating a measure of this kind and steps in this direction. Lord Sinha had charge of the Bill in the Upper Chamber, and the Royal Assent was accorded on Dec. 22.

HIGHER OLD AGE PENSIONS.—On the eve of the adjournment, the Government agreed to the obvious desire of the House of Commons to increase the old age pensions, and on Dec. 19, after the necessary money resolution had been dealt with the House passed through all its stages a

Bill to raise the pension to zos, a week, the increased expenditure being estimated at £zo,coc,coc. The Upper Chamber followed suit on Dec. zo, and on the following day the measure received the Royal Assent. The increase can into force on New Year's Day, though it was a few weeks later before it was possible to make the extra payments, which varied according to the income of the pensioners.

THE FIRST WOMAN M.P.—As a result of the Plymouth bye-election, Viscountess Astor, the wife of the former member who necessarily resigned on succeeding to a prerage, became the first woman M.P. to sit in the House of Commons She took her seat on Dec. r, the Prime Minister and Mr. Balfour acting as her sponsors in a crowded Chamber. Lady Astor postponed her maiden speech until the following Session, but was in constant attendance. A Bill to remove disqualifications of sex in regard to the Bench and Bar, the magistracy and juries, was passed during the sitting The Commons on Oct. 27, by 171 to 84, inserted an amendment to enable a peeress in her own right to sit in the House of Lords but the Upper Chamber deleted this proposal on Nov 11, and the Commons accepted the correction.

THE HOUSING SCHEME -Although Dr Addison admitted on Nor as that the actual building under the Housing Act was trivial, he said that real progress had been made. The Ministry of Health had approved \$4,000 acres of land properly laid out and planned for housing, and a further 24,000 acres had been surveyed and would mostly be accepted. To assist the situation, he explained, the Government had decided to offer a subsidy towards the cost of building houses at once. Any person who built within a specified time a house of an approved type would receive a maximum subsidy of £150, based on the cubic feet of space. Steps would be taken, Dr. Addison added, to prohibit nonessential "luxury" building, such as cinemas. The Prime Minister appealed to workmen to put their backs into the work, and asked local authorities to organise local loans for housing A Bill was later passed to provide for the subsidy, Dr Addison, in moving the second reading on Dec 8. stating that the giants in aid would be from £130 to £150, according to the size of the house concerned. Local authorities were authorised by the measure to issue bonds to help them in financing their schemes

THE CHURCH'S NATIONAL ASSEMBLY --The Bill introduced by the Archbishop of Canterbury in the House of Lords to set up a National Assembly of the Church of England, with powers to legislate on matters affecting the Church, was given a second reading in the Commons on Aon. 7 by 304 to 6 In moving the second reading, Sir E. Beauchamp said that out of any Church Bills that had entered the House in the past thirty years, 183 had been lost and had never been heard of again. The third reading was secured on Dec. 5, after the inse tion of an amendment that the Lord Chancellor and not the Lord Chief Justoe should nominate the members of the Upper House to serve on the Bodeslastical Committee. To this the House of Lords agreed on the suggestion of the Primate, and the Royal Assent was given on Dec. 23, when Parliament was given on Dec. 23, when Parliament was provided.

#### SESSION rose.

THE KING'S SPEECH.—The new Session was opened with full State, for the first time since 1914, on Feb. 10, the Prince of Wales being present when the King, who was accompanied by the Queeu, read his Speech from the Throne. Among the legislation promised were the Bills for the better government of Ireland, for the adjustment of the financial arrangements of the Colonies. and the acquisition of coal royalties by the State. Other measures mentioned related to licensing, insurance against unemployment, and minimum wages, while proposals were announced to reform the Second Chamber. His Majesty alluded with pleasure to the coming visit of the Prince of Wales to Australasia. Satisfaction was expressed at the conclusion of the war with Germany, and the King declared that, to assure the full blessings of peace to Europe, it was essential that normal conditions of economic life should be restored in Russia. In the Upper Chamber the Address in reply, moved by the Marquis of Dufferm and seconded by Lord Charnwood, was agreed to on the same day. The Address in the Commons was moved by Lieut -Col S. Peel, D S.o., and seconded by Mr. W. J. U. Woolcock. The Prime Minister expressed the hope that the House would apply itself to the great programme of legislation before it with the same industry, comage, and breadth as it had shown in the previous year. The Government were, he said, effecting the strictest and most relentless economy in every department of State. Referring to Russin, he said it was perfectly clear that Bolshevism could not be crushed by force of There were objections to making peace with the Bolshevists until the Government in control of Russia had dropped its methods of barbarism and adopted civilised means. They had failed to restore Russian sanity by force, but believed they could do it and save her by trade. "There is but one way," he declared, "we must fight anarchy with abundance." On the following day a Labour amendment demanding nationalisation of the coal mines was rejected by 329 to 64, and the Address was agreed to on Feb x3, after the defeat of an amendment criticising the Peace conditions by 254 to 60, and another expressing regret at the high Government expenditure by 188 to 44.

THE GOVERNMENT OF IRRLAND.—The Bill outlined by the Pame Minister for dealing with the hish situation was presented by Mr. Macpherson on Feb. 25, and received a second reading by 348 to 94 on Warch 3x, after a three days' debate. The Itish Secretary said the proposed Council might become a real stepping-stone in the direction of union, its powers might be increased until it became a complete Parliament for It was intended to apply proportional representation to all elections to the two Irish Parliaments, which would consist of 128 members for the Southern Parliament and 5s members for the Northern Parliament. The office of Lord Lieutenant would continue to exist, but there would be no religious disability attaching to the office, and there was no provision for the continuance of the post of Chief Secretary. The rejection was moved by Mr. Clynes. Mr. Asquith opposed the proposals, and said that no section of the Irish nation asked for them. He described the Bill as cumbrous, costly and unworkable, and urged that Ireland should be given the status of a dominion. Mr. Bonsr Law said he was not

very sanguine that they were going to obtain a tlement in Ireland, and Sir Edward Carson said that although Ulater did not want the Bill, ahe would do her best. Mr. Lloyd George winding up the debate, said he believed that they would get union in time from the Bill. The Committee stage opened on May 10, when Mr. Asquith moved an amendment, designed to set up a single Parliament, but giving counties the opportunity of withdrawing for a time from its jurisdiction. This was defeated by 250 to 55. On an amendment moved by Lord Robert Cecil on May 18, Mr. Walter Long accepted the principle of a second Chamber for each of the Irish Parliaments, and on June 3 the Government accepted an amendment preventing the transfer of the police forces from the control of the Imperial Government for three years after the Bill came into operation. Another amendment agreed to (on June 22) increased the number of Irish M.P.'s at Westminster from 4s to 46, by retaining the four University representatives. The further consideration was delayed until after the recess, but before the adjournment steps were taken to deal with the outbreak of lawlessness in Ireland, an emergency Bill, setting up special tribunals to supersede civil courts which had broken down, and empowering the Government to stop grants to local authorities which refused to discharge their duties, being passed.

THE BUDGET. - Enormous totals and many changes in taxation were revealed in the Budget presented by Mr Austen Chamberlain on April 10. The Chancellor estimated the deadweight debt on March 31 at £7,835,000,000, and the floating debt at £1,312,205,000. For the year just commencing he put the total revenue, on the existing basis of taxation, at £1,341,650,000, and the expenditure at £1,177,452,000, leaving some £154,000,000 for the reduction of debt. This surplus he did not consider sufficient, and Mr. Chamberlain intimated that he intended to call upon the nation for further generous efforts to improve our position, to lighten our future burden, and to establish securely our national Coming to his proposals, the Chancellor first dealt with the loss on the Post Office, and announced increases in the letter postage to ad for three ounces, and a halfpenny for each additional ounce, in the newspaper postage to zd. for six ounces, in telegram rates to a minimum of 18, and in the parcels post corresponding to the rail rates. These changes, he estimated, would produce £6,500,000 this year. The existing motor-car tax and motor spirit duty would be continued until the end of the year, when they would be superseded by a new licence duty on motor vehicles estimated to produce £9.000.000 in a full year. After intimating that the Cabinet had decided to repeal the land values duty, which, he said, had produced hardly any revenue, Mr. Chambeilain said the duty on spirits would be increased by ass. 6d. to 78 6d. a proof gallon (yielding £4,500,000 in a full year), and that on beer by 30s. a standard barrel, or one penny a pint (producing £30,000,000 in a full year), the wine duties would be doubled, and there would be imposed a special so per cent. ad raiorem duty on imported sparking wines (producing £4,800,000 in a full year), and a 30 per cent. ad valorem duty on cigars (£330,000 in a full year). Dealing with incometax and super-tax, he said he proposed to adopt, with some triling modifications, the recommendations of the Royal Commission in regard

to graduation. These gave relief to families with marital responsibilities. In a full year the net cost to the Revenue from these, changes would be £18,000,000, and a further charge to the Exchequer would result from relief in cases of double income-tax within the Empire. Excess Profits Duty was increased to 60 per cent. until cancelled by a levy on increases in war wealth, and he proposed a new tax in the form of a Corporation Tax of 15, in the £ on the profits and income of concerns with limited liability engaged in trade. The Chancellor esti-mated the changes to produce in a full year £198,330,000, while in the current year they would give an additional revenue of £76,650,000, making a total of £1,418,300.000. Approximately that would give £234,000,000 for the redemption of debt. On the following day Mr. Asquith appealed for the cessation of borrowing by the State, and for a reduction of debt in order to secure economy, while Mr. Clynes urged the imposition of a capital levy and greater production. Mr. Chamberlain justified the Excess Profits Duty, though not as a permanent part of the financial system. On the resolution for this tax, Sir Frederick Banbury moved its reduction from 60 per cent. to 40 per cent., but the Chancellor said it was impossible for the Government to accept the amendment, which was defeated by 287 to 75, and the Finance Bill was read a flist time on April 28. The second reading was agreed to without a division on May 12. A resolution moved by Mr. Clynes, expressing regret at the Government's decision not to impose special taxation on war fortunes, was defeated special taxation on war fortunes, was decreated by a44 to 8r on June 8. During the Committee stage, on July 6, Mr. Chamberlain agreed to reduce the additional duty on sparkling wines to 33/4 per cent. On July 12 the House by 359 to 117, rejected an amendment the effect of which would have been to reduce the Excess Profits Duty from 60 per cent. to 40 per cent., and on the following day a similar fate met an attempt to omit co-operative societies from the operation of the Corporation Profits Tax. A new clause, designed to alleviate the pressure of the Excess Profits Duty in respect of new businesses and small businesses. was added by the Chancellor, as was another giving power to the lieasury to borrow on National Savings Certificates for purposes of investment is housing and other loans. The Committee stage was concluded on July 16, and the third reading was secured on July as. House of Lords quickly passed the measure, and separate legislation was agreed to providing for the Post Office changes

POST-WAR LEGISLATION.—Moving the second reading of the Indemnity Bill on May 3, Sir Ernest Pollock said it dealt with the indemnity granted to persons who had carried out duties for the purpose of maintaining order and discipline during the War, and validated certain acts of grace and regulations made in different parts of the world. The measure provided that no proceedings should be instituted if the acts in question had been done in good faith. Another clause made valid sentences passed and judgments given by military courts in connection with the War or the occupation of territory by British forces. The Solicitor-General remarked that if a legal decision were allowed to stand, the Government might become liable for extra sums amounting to £8ga,cso,coo.

Sir Ernest said it was not intended to deprive the subject of compensation, of going to a court, or of the right of appeal, but it was to ensure that the same measure of compensation would be meted out to those whose claims had not been decided. The Boyal Assent was given on the day of the adjournment. Another Bill, passed earlier in the Session, concerned the Peace Treaties with Anstria and Bulgaria, Mr. Cecil Harmsworth, in moving the sc cond reading on April 24, stating that it simply invested the King with the powers necessary for carrying out the business that followed the ratheration of peace

THE COAL INDUSTRY - A measure making temporary provision for the control of colliery undertakings and the wages of miners until a more important scheme for the regulation of the industry could be set up was passed early in the Session. Later a Bill to establish a Ministry of Mines as a department of the Board of Trade was introduced. In moving the second reading on June 30, Sir Robert Horne said that the Government had come to the conclusion that nationalisation was not wanted, justifiable, expedient, or in the interests of the industry. As to the Bill, he said there was overlapping among the departments which dealt with various phases of the coal industry. The Minister of Mines would be an Under-Secretary of the Board of Trade, and only fesponsible to the President in matters that really involved large policy For the regulation of the industry it was proposed to set up a series of pit and district committees or boards and a national board, the country being divided into 26 districts and six areas for this The area boards would have power to formulate schemes for adjusting the remuneration of the workmen on the basis of the profits of the industry in each area, the national board laying down general principles The second The House of reading was carried by any to or Lords, in Committee on Aug. 4, made the Minister of Mines only an Under-Secretary of the Board of Trade, and the Commons accepted this amendment, the Bill receiving the Royal Assent on Aug. 16, when both Houses adjourned until Oct 19

THE NIW RINES ACT Further legislation on the subject of rents was contained in a Bill based upon the recommendations of a committee appointed to consider the question. In moving the second reading on June 4, Dr Addison said that it extended for three years the security of tenure of tenants of dwelling-houses obtained under previous statutes, and raised the limits of the rents to which the restrictions applied from Lyo to Lios in the metropolitan area, from Lio to Lyo in Scotland, and from Lio to Ly6 elsewhere. It made provision for an increase of rent to meet the increase of mortgage interest In the case of houses up to £75, the Bill allowed an increase in rent up to 30 per cent-- 5 per cent in respect of increased mortgage interest and as per cent, in respect of increased cost of repairs, while an increased tent of 40 per cent, was permitted in the case of houses of a rental from £75 to £105, made up of 25 per cent. and 25 per cent. The operation of the increase of rent might be suspended where the house was not reasonably fit for human habitation, or was not in a reasonable state of repair. A fine was imposed for extorting key money. The Standing Committee, by 15 to 22, applied the Bill to business premises on June 13 against the Government's wishes, and the measure received the Royal Assent, with this addition, on July a.

HEALTH AND UNEMPLOYMENT INSURANCE. By a Bill which received the Royal Assent on May so, the State health insurance scheme was amended to meet the after-war conditions. Moving the second reading on March sa, Dr. Addison said the sickness benefits would be increased for men from 10s to 15s. a week, and for women from 7s. 6d. to 1ss., and the disablement benefit from 5s. to 7s. 6d. for both men and women. Apart from the increased Treasury contribution, this involved an extra payment of 3d per insured person, of which ad was to come from the employer and id. from the employee. Maternity benefit was advanced from 30s. to 40s. Sanatorium benefit was taken out of the Insurance Act altogether, as the first stage in a comprehensive policy of dealing with the whole problem of tuberculosis in respect of all sections of the population The unemployment insurance scheme was also amended by a Bill which raised the number of insured persons to some fifteen millions Sir Robert Horne, on the second reading on Feb. 25, said the workman's contribution would be 2d. per week, that of the woman would renain 25/d., and boys and girls would pay 2d and 15/d each. The benefits would be 15%, for men, 12% for women, 7% 6d for boys and 6s for girls The employer would pay 3d, a week for each insured person, and the State's contribution would be ad. Several attempts by the Labour Party to prevent friendly societies from participating in the administration of the scheme were defeated.

OTHER SOCIAL LEGISLATION -Among the other measures which were passed before the recess were Bills to keep the Ministry of Food in existence for a further period, and a Bill to con timue in operation for another year and to make more efficacious the Profiteering Act Another new Bill compelled local authorities to make provision for the training and maintenance of all blind persons, and entitled all blind persons who were unable to work to the Old Age Pension at the age of 50 The Franchise Act of rgr8 was amended to the extent of abolishing the delay in the counting of votes at Parliamentary elections, and in its place extending the right of voting by proxy to all absent voters. By the Silver Coinage Act the fineness of the Imperial silver coinage was reduced owing to the greatly increased price of silver bullion. The House of Lords passe ta Bill embodying the recommendations of the Royal Commission on Divorce, among them the equality of the sexes in regard to the right to divorce, but the other Chamber did not proceed with it before the adjournment, though it carried on April 14 a motion declaring that any change in the law that would impair the permanence of the marriage contract would be harmful to the best interests of the com-Separate measures providing for the taking of the Census in Great Britain and Ireland were also passed, the former being in the nature of a permanent measure, empowering the Minister of Health, by Order in Council, to direct that a census should be taken for Great Britain or any part thereof, and enabling a census every five years instead of every ten years. The Labour Party secured a second reading for a Bill to extend the franchise to women on exactly the same terms as men, the age limit of 30 years being reduced to az years, but, owing to the difficulty of obtaining a quorum in the Standing Committee, further progress abandoned.

# NATIONAL GALLERY OF BRITISH ART

(The Tate Gallery), Millbank, S.W z.

The vational Gallery, was opened in 2017 on the site of Milhank Gallery, was opened in 2017 on the site of Milhank Gallery, was opened in 2017 on the site of Milhank Gao, the coat of erection (200,000) being horne by Sir Henry Tate, who also contributed the nucleus of the present collection. The "Turner Wing," built at the expense of the late Sir Joseph Duvoen, Benr. was opened to the public in 200.

Director, Charles Aitken Acting Asst Keeper and Clerk, James B. Manson Sign to Agen

### MATIONAL INSURANCE AUDIT DEPT.

Head Office, 3 Regent Street, S.W. z. By the National Insurance Act, sazz, it is provided that the accounts of Approved Societies, Branches, and Insurance Committees shall be submitted to audit by auditors appointed by the Treasury. This Department was created by the Treasury Minute of August & spec.

Nas develoted by the Tensory and the St. August 9, 230;

Secretary, W. A. Middleton, o.s., Actg Ch. Auditor),

Chief Inspector of Audit, M. W. Dixon (Actg. Sec.),

Cle k in Charge of Accounts, R. McCornnack

Inspectors of Audit, (7); Auditors, (47); Assistant

Auditors, (23); Audit Cle Ls, (132).

# NATIONAL PHYSICAL LABORATORY,

The National Physical Laboratory was founded in the year spot as a public Institution for standardising and verifying instruments, for testing materials, and for the determination of physical constants. Prior to the year spit, the property of the Laboratory was twested in the President and the Council of the Royal Noviety, and the Luboratory was controlled by a General Board and an Executive Committee, appointed by the President and the Council of the Royal Noviety, and the Luboratory was controlled by a General Board and an executive Committee, appointed by the President and the Secretary and of the great Technical Institutions. As from April 2, 2018 the greatonibility for the the solution is a superstance of the great Technical Institu-tions As from April 1, 2028, the responsibility for the maintenance of the National Physical Laboratory was undertaken by the Department of Scientific and Indiatrial Research

maintenance of the National Physical Laboratory was undertaken by the Department of Scientific and Industrial Research

The Laboratory comprises eight main sections:—(a) The Physica Department includes divisions for Heat and Thermometry, Optics, Sound, Radium and X-Ray work, and Tide Prediction (a) The main divisions of the Electricity Department deal respectively with Electrical Standards, General Electrical and Magnetic Measurements, Alternating Current Test and Research, Direct Current Measurements and Photometry (3) The Methodopy Department is responsible for the Laboratory Standards of length, area, volume and mass, and among the various branches of work-deals with are the varifical towards branches of work-deals with are the varifical target, etc. the testing of engineers' gauges, including series gauges measurements of area, volume, and mass, the testing of barometers, hydrometers, taximeters, watches and chromometers, and the highest class of scientific glassware for volumetric measurements. The glassware testing has recently been re organised on an increased scale owing to the growth in the manufacture of such ware in this country during the war When the Ministry of Munitious was formed, the Laboratory was called upon to undertake the testing of the gauges, the work assumed very large dimensions, and a special building for its accommediation was provided. (4) The Engineering Department carries out research on engineering trick of the section of road materials (3) The Aerodynamics Department conducts researches on aircraft models and parte as required by the Aeronautical Research-Committee of the Air Ministry, investigations on light alloys and other materials, engines and Electrotechnics Department, and the William Froude National Tank (6) The Department of the Full Tank (6) The Department of the Aerodynamics Department and the William Froude National Tank (6) The Department of the Aerodynamics of the mation, carries out tests and researches on siels, and propeller models for the information of designe

POST OFFICE. Chief Office, St. Martin's-le-Grand, E.C. z.

Chief Office, St. Martin's-le-Grand, E.C. z.

A House of Commons report in \$80, states: "It is uncertain at what precise period the Crown undertook to be the regular carrier of letters for its subjects." The first "Master of the Posts" was spjonized in 1826, but the duty was not then undertaken as a remumerative department of the Government. The Post Office is now one of the three great revenue-collecting departments, and while efficiently discharging its multifarious duties, shows a large annual profit. It also receives large sums for duties and taxes on behalf of the Inland Revenue Department, for certain licenoes for the Customs and Excise Department and the County Councils and for National Insurance on behalf of the National Health Insurance Commissioners and the Board of Trade. The Post Office also pays Old Age Fennions. The Fenny Fost was insuranted in size, the Board of Trade. The Councils have been supported by the Post Office Savings Shenk in \$85., the Fost Office Telegraphs in \$85. the Post Office Telegrap

### PRIVY COUNCIL OFFICE, Whitehall, S.W. z.

PRIVY COUNCIL OFFICE, Whitehall, S.W. z. The Privy Council is of very ancient origin. A Council, the number of which was about twelve, was instituted by Alfred \$85, and it discharged the functions of State now confined to members of the Cabinet. In the Middle Ages the Chief Advisers of the King who were permanently about him formed the Privy Council. Having become unwieldy, it was reconstituted in \$679. At present it consists of certain eminent persons whose names are given on p. \$35. Members of the Cabinet must be Privy Council. The Council is summoned as such to act with others' upon the denise of the Chowra, and many masters are referred by the Sovereign that the council cou

### THE PUBLIC RECORD OFFICE. Chancery Lane, W.C. z.

The Public Record Office as it now stands was completed in 2000 for the age onstody of the Public Records, which were first ordered to be kept by Henry 1 at the beginning of the twelfth century. The administrative expenses were estimated at £37.550 in 2200-27 (For hours see p 352.)

QUEEN ANNE'S BOUNTY, 3 Dean's Yard,

Incorporated in rest, when Queen Anne, with the consent of Parliament, transferred to the inversions the annual income of the "first fruit" and "centhes" derived from the sees, dignitaries, and bonefit es, with a view to the aumentation of insufficiently enlowed part of the Crown revenue by Henry VIII. More than last of the benefices in England and Wales are free from these charges, having either been exempted from them by statute on formed since the charges were imposed. First fruits represent one years income of a benefice in the time of Henry VIII. It the "tenthe" an animal sum of a tenth part of that income. The income from this source amounts to about £25,000 per year, which, with the surplus income from capital in the by the Governors, is distributed in grants towards the relief of displatation measurements on benefices and exceeding Governors, is distributed in grants towards the relief of dispidation assessments on benefices net exceeding \$300 in net annual value. The Governors at as trustees for endowments and many descriptions of Church funds. They are also empowered to lend money upon mortages of benefices for improvements to parsonage houses and farm buildings, in certain cases for rebuilding chancely, and for dilapidations.

TREASURY, Whitehall, S.W. z. The Lord High Treasurer of England is the Third trent Officer of State, the office having been "in commission" (with certain internals) since risz. The Commissioners for executing the office of Treasurer of the Exchequer of Great Britan and Lord High Treasurer of Ireland consist of the First Lord, who, if a Commoner, is ex-office, Leader of the House of Common, the Chancellon of the Exchequer, and some Junton Lords, with certain Secretaries and a staff of officials. The duties of the First Lord are mainly political, as also are those of the Parlismentary Secretary and the Junion those of the Parliamentary Secretary and the Junion Lords, the duties of the Chancellot of the Exchequer are mainly financial, in that he performs the ancient duties of the Under Treasures and after agreement with the of the Under Treasure and after agreement with the heads of the great spending departments, armages for the great collecting departments to provide sufficient moneys to neet the needs of the vear. The papers are laid before Parliament in the form of a Budget, which the Chancellor expounds to the House, those plans being accepted, modified, or rejected by the House. The amount estimated to pay the salaries and other expenses was £197,579 in 1994 50.

### THE WAR OFFICE.

Whitehall, S.W. z.

In 180s, the Secretary of State for War was also given the huainess of the Colonies, of which he was relieved in 184s by the appointment of a Secretary of State for the Colonies

In zegs the Commissariat Office, which was only a emi-military branch of the Army with headquarte wat he Treasury, was transferred to the War Departmen. the Treasury, was transferred to the War Departmen , the Board of Ordnance was abolished, after an exiton c

of more than three ce ituries, and the Board of General Officers and the Army Medical Department were also successively showhed into the War Department. The year 1870 witnessed the final welding into one War Office of the civil administrative functions of the Secretary State and the military administrative function in the rotate of the Mary Office exercised at the Horse Guards. In that year the War Office Act vested the direct and immediate control of every branch of Army wiministration in the Secretary of State. Refore the appointment of a Secretary of State, the milibranch of Army administration in the Secretury of State. Before the appointment of a Secretary of State, the military control of the Army was, to a very great extent, in the hands of the Commander-in-(hief. who was subordinated to the Secretary of State from sign until the abolition of the Officer 1994. In 1994 In 19

#### THE REGULAR ARMY.

Before the War of 1914-1918 the Regular Army of the United Kingdom consisted of voluntarily enlisted the United Kingdom consisted of voluntarily onlisted acidiers, and amounted to about age, see all ranks. At the outbreak of War it was increased by the embodiment of the Special Reserve, Militia, and Terrizontal Unita, and by voluntary enlistment into "Service Unita" of the New Armies, until the adoption of Compulsory Service (May 24, 1915.) During the War a total of 5,750,000, all ranks, passed into the Armies of the United Kingdom, and at the conclusion of Peace (June 25, 2539) offorts were made to effect a temporary reduction to 2000,000 all ranks, with a view to the reduction to 900,000 all ranks, with a view to the ultimate reduction of the land forces within such reach of pre-war establishments as the increased area of the British Empire may permit.

The Rogular Army consists of the following units .-

Cavalry.

Household Cavalry,—set and and Life Guards and the Royal Horse Guards ("The Blues"). Cavalry of the Line.—set, and, 276, 4th, 5th, 6th and 7th Dragoon Guards; 1st and and Dragoons, 31d,

4th, 7th, 8th, 10th, 12th, 12th, 14th, 15th, 18th, 19th, and soth Hussars, 5th, 9th, 12th, 18th, 17th, and 12th Lancers, and 6th Dragoons.

#### Royal Regiment of Artillery.

Royal Horse Artillery -Battories, distinguished by letter

## COST OF THE ROYAL AIR FORCE,

Air Force estimates for 1020 -21 show a net expenditure of £15,173,430, representing a reduction on the revised figures for 1919-20 of € 38,857,420.

Details of the Estimate. Pay, etc of the Royal Air Force . . £4,310,500 Quartering, stores (except technical), supplies, and transport . 1,985,000 Technical and warlike stores .. 2.772,850 Works, buildings, and lands 2 785,000 Air Ministry 877,000 Miscellaneous effective services 100,000 Civil aviation 894,540 1,381,540 Expermental and research services . . Half-pay, pensions, and other neneffective services... ......

67,000 Total . .... £15,173,430

#### Total .... ...... .£127,303,630

... .. .... .£68,481,630

12,530,000

9,630,000

4,066,000

27,307,000

5,289,000

Sums estimated at £47,000,000 and £34,000,000 respectively due from Germany for the maintenance of the Rhine Army, and from the Dominions for the maintenance of their forces in the field, are not appropriated in aid of Army Estimates, but will be brought to account as revenue, when received.

COST OF THE ARMY The anticipated net expenditure for the year

1920-21 is £127,303,630, the total establishment provided for being 525,000 officers and other ranks, a total which is in process of reduction to

280,000 all ranks. The £127,303,630 is accounted for as to £55,000,000 for the Army on the basis of

the 1914-15 establishment, as to £29,500,000 for

Terminal Charges of the War, and as to £40.500,000 for the provision of Garrisons in

#### METEOROLOGICAL OFFICE.

The Meteorological Office was established as a Depart The measurongical value was esseminated as a bepart ment of the Board of Trade in 1884. Changes have been made from time to time in the management, and in 1919 the Control is vested in a Director and Committee appointed control is vested in a Director and Committee appointed by the Air Council. The Gassist Committee of the koyal Society is an Advisory Committee for geophysical subjects. The work of the Office Includes. The collec-tion and discussion of meteorological observations from occans and land areas all over the world the main tenance of a number of stations for daily telegraphic reports upon which gate warmings and forecasts are

based: the maintenance of observatories for the study of weather, with which are associated other geophysical dupects, and the maintenance of stations in various cathered of the country for the supply of meteorological information and other requirements of aircraft. The British Rainfall Organisation, founded by G. J. Symons in 2500, has recently been associated with the Meteoro-

in Reco., mas location.

### THE AIR PROGRAMME, 1920-21.

### ORDER OF WAR MEDALS.

The Army Council has given instructions that stars and medals approved for service during the Great War will be worn in the following order -1914 Star or 1914-15 Star : British War Medal ; Mercantile Marine War Medal ; Victory Medal : Territorial Force War Medal ; India General Service Medal (for operations against Afghanistan, zozo).

#### CIVIL AVIATION.

Returns supplied voluntarily by civil aerial transport firms in the United Kingdom for the period May 1 to Dec 31, 1919, show that for Great Britain and on the Continental route 403 machines were in use, 35,330 flights were made, and 8,368 machine hours were flown, the mileage totalling approximately 593,000 The number of passengers carried was 64,476, and the weight

of goods carried amounted to 67,x43 lbs
The following figures show the proportion of

18

465

accidents over the whole period . Total accidents reported

Approximate number of machine miles

flown per accident .. ....... 32,900 Approximate number of machine flights

per accident 1,960

Approximate number of machine hours flown per accident . ......

During the period under review four pilots were killed and six injured, and one passenger was killed and ten were injured; a third party being killed by a pony-trap accident, in which an aeroplane collided with a pony-trap. The above figures do not in lude the flights to Australia for the £x0,000 prize offered by the Commonwealth Government.

The sums appended to the various offices are the full incomes derivable from the estates and revenues of the Church The Deans and Chapters of certain Dioceses (wairked "in the julicomy juppes) preferred several years ago to retain in lean of Keod annual money payments, estates estimated at that time to pi dure the same annual income

The Doans and Chapters of certain Dioceses (market " in lieu of fixed annual money payments, estates estimated	at that time to produce the same annual sucome

Diocese

### MEMBERS OF CONVOCATION.

#### PROVINCE OF CANTERBURY.

#### Upper House.

President —The Most Rev. the Lord Archbishop.
The Right Rev. the Lords Bishops of Bath and

Wells, Birmingham; Bradford; Bristol; Chelmisford, Chichester; Coventry; Ely; Exeter; Gloucester; Hereford; Lichfield; Lincoln, London, Norwich; Oxford; Peterborough, Rochester; St. Albans; St. Edmundsbury & Ipswich, Salisbury, Southwark; Southwell, Truro, Winchester, Worcester.

Apparitor-General, H. T. A. Dashwood.

#### THE BOYS' BRIGADE. (Incorporated.)

THE senior boys' organisation; founded in 1883 by the late Sir William A. Smith. The object of the Brigade is attained by a combination of military and religious training. Every Company is connected with a Church or other Christian body. Many of the Battalions and Companies are now recognised as Cadet Units. The total strength is 60,000 officers and boys. Sec., R. S. Peacock, 34 Paternoster Row, E.C. 4.

#### CHURCH LADS' BRIGADE.

An appendage of the religious influence of the Parish Church; was founded in z8pz, and combines a military organisation with moral and religious instruction. It is estimated that 500,000 lads have had the advantage of the Brigade's training, and to-day there are 1,327 Companies throughout the Empire, with upwards of 60,000 lads.—Headquarters, Aldwych House, Catherine Street, W.C.s. Brigade Chaplain and Secretary, Rev. Edgar Rogers. M.A.

#### Lower House.

Prolocutor, Rt. Rev. Bishop Ryle, D.D.. Dean of Westminster. The Very Rev. the Deans; the Venerable the Archdeacons; and the Elected Proctors. Registrar, F. H. Lee.

PROVINCE OF YORK -Upper House.

President.—The Most Rev. the Lord Aichbishop.

The Right Rev. the Lords Bishops of Callisle; Chester; Durham; Liverpool; Manchester; Newcastle; Ripon; Sheffield, Sodor and Man; Wakefield.

#### Lower House.

Prolocutor, Rt. Rev. the Bishop of Beverley, D.D.
The Very Reverend the Deans of the Province;
the Venerable the Archdeacons; and the
Elected Proctors Registrar, A V. Hudson.

#### BOY SCOUTS. (Incorporated).

A Movement initiated and organised by Lieut.-General Sir Robert Baden-Powell, K.C.B., K.C.V.O., Chlef Scout, to develop good citizenship among boys by forming their character—training them in habits of observation, obedience and self-re'iance; inculcating loyalty and thoughtfulness for others; teaching them services useful to the public and handicrafts useful to themselves, and promoting their physical development and hygiene.

During the War some 100,000 Boy Scouts were employed on war work, over 100,000 joined the Colours, and a continuous service of coast-watching under the Admiralty was maintained. The Movement has taken root in all parts of the British Empire, and nearly every other country has adopted it.—Imperial Headquarters, as Buckingham Palace Road, S.W. z.

#### ST. PATRICK'S NATIONAL CATHEDRAL, DUBLIN.

Dean and Ordinary, Very Rev. Charles Thomas Ovenden, D.D.

#### GENERAL SYNOD,

Consisting of House of Bishops (x3) and House of Representatives (viz., 208 clerical and 416 lay). Honorary Secretaries, Ven. L. A. Pooler, D.D., Very Rev. H. V. White; J. A. Maconchy; Major E. H. C. Weilesley.

Secretary to the REPRESENTATIVE CHURCH BODY (INCORPORATED 1870), A F. Maude, 52 St Stephen's Green E., Dublin.

By the Act of Union, 1800, the Church of Ireland was united with the Church of England, and the Sovereign, as one of its members, supreme governor on earth By the Act of 1869 this union was severed, and on Jan. 1, 1871, the Church of Ireland resumed her independent position. The Act of 1869 not only disestablished the Irish Church, but also took away her endowments, nothing being left but the right to the life services of the Annuitant Bishops and Clergy (which were commuted for a capital sum), the right to claim churches in use for divine service, the right to buy the See and Glebe Houses (with garden and curtilage), and £500,000 in lieu of private endowments.

The supreme governing body of the Church of Ireland is the GENERAL SYNOD, which meets annually.

Subject to the GENERAL SYNOD are 23 Diocesan Sunods, which are assisted by smaller elected bodies called Diocesan Councils.

The Bishop of the Diocese is chosen by the clerical and lay members of the Diocesan Synod. The Primate is chosen by the House of Bishops from amongst their own number.

The incumbent of the Parish is appointed by a Board of Nommation, consisting of 7 persons, viz —The Bishop, 3 diocesan nominators (2 clerical and 1 lay) appointed by the Diocesan Synod, and 3 parochial nominators (lay) appointed by the registered vestrymen of the parish.

The financial trustees of the Church are the REPRESENTATIVE BODY, composed of the Archbishops and Bishops, 13 clergymen and 26 laymen, chosen by the Diocesan Representatives in the General Synod, with 13 or-opted members (clerical or lay) This body holds the property of the Church, and administers its funds, subject to the General Synod.

The first property it held was the capital sum 57,581,075, representing the life annuities of the Bishops and Clergy paid over as commutation money by the Church Commissioners, and also £500,000 compensation for private endowments. The commutation capital on 31 Dec., 1918, was only £125,300, charged with annuities to 40 annuitants. The funds, however, in the annutants and the Representative Body amounted in all to £9,569,302, made up of Commutation £6,981,566, £,135,320, Parochial Sustentation £6,981,606, Episcopal Sustentation £563,685, General Synod Funds £577,127, and Miscellaneous purposes £1,311,565

Since 1869 members of the Church have paid in to the Representative Body a total sum of £8,616,597 The interest of the Diocesan and £8,616,597 The interest of the Diocesan and Parochial Sustentation Fund is approximately £347,000. The total amount of assessment for stipend paid by parishes, 1919, was £102,340, and the total amount paid for stipends under Diocesan Schemes was £354,43.

The number of members of the Church of

Ireland, by the Census of 1911, was 524,375, or 120 per cent of the entire population.

#### THE EPISCOPAL CHURCH IN SCOTLAND.

THE RT REV BISHOPS. Cons Clgy Stipd

THE RT REV BISHOPS Cons Cigy, Stind. With residence

Registrar of the Episcopal Synod, George J. Wood, W.S., 14 Young Street, Edinburgh, Churches, Mission Stations, &c., 416. Parsonages, 195. Clergy, 333. Communicants, 55,212.

## The Church of Scotland.

THE CHURCH OF SCOTLAND by law established published in 1360, abolished the imposition of Presbyterian in constitution, and is governed hands in the ordination of the clergy, but is Presbyterian in constitution, and is governed by Kirk Sessions, Presbyteries, Synods, and the General Assembly, which consists of both clerical and lay representatives from each of the Presbyteries, and also from the Universities and Royal Burghs. It is presided over by a Moderator (chosen annually by the Assembly), to whom the King has granted precedence in Scotland, during his term of office, next after the Lord Chancellor of Great Britain. The Sovereign is represented by a Lord High Commissioner appointed each year by the Crown), who receives the sum of £2,000 towards his expenses. The country, for Church purposes, is divided that of the country of th The country, for Chinese purpose, in the country, for the country are over 1,800 ministers and licentiates anguard in ministerial work. The Church engaged in ministerial work population exceeds the aggregate of all the other Presbyterian bodies, and is estimated at about half the whole population of Scotland; the number of communicants at the close of rose was 728,230 The sum of £643,589 was raised in 1919 for church and missionary purposes Within the last 50 years 500 chapels, at a cost of £x,830,000, have been endowed and erected into parishes quoad sacra The parish churches number 1,457
There are in addition 247 churches and mission stations, in all of which worship is regularly conducted

Until 1560 the Church of Scotland was Roman Catholic, but in that year the Scots Parliament abolished the jurisdiction of the Pope, proscribed the Mass, and ratified a Confession of Faith drawn up by John Knox and other divines. In it all essential articles of the ancient creeds of the Church were adhered to Ceremonies were declared to be temporary in their nature, and should be altered when they began to foster superstition. The First Book of Discipline,

nature in the ordination of the clergy, but superintendents were appointed to appoint ministers and to plant and erect kirks. The Church, so reformed, was governed by a General Assembly composed of the Superintendents, ministers, and lay commissioners. A Second Book of Discipline was sanctioned by the Scota Parliament in 1581. Presbytery was settled in 1590. The restoration of the rights of the Bishops, civil and ecclesiastical, was, however, sanctioned by the General Assembly of zoro, and three Scottish Bishops were in that year consecrated in London. Further innovations by King James VI. alarmed the people, and the attempt of Charles I. to impose on the Church a Book of Canons and a Liturgy was met by the National Covenant and the restoration of Presbyterian forms, which culminated in the Westminster Confession of Faith in 1646. At the Restoration the Church again became Episcopal, but in 1690 the Scottish Parliament re-established Presbyterianism. By the Treaty of Union between England and Scotland (ratified by the English Parliament 6 Anne c n.) the Church of Scotland was secured in its Preshyterian form, and the very first official act of a sovereign of the Butish Empire on his accession is to take an oath to maintain inviolably this settlement.

LORD HIGH COMMISSIONER, Duke of Atholl, K.T., C.B , D.S.O.

MODERATOR, 1920, Rev. Thomas Martin, D.D., Principal Clerk, Rev. David Paul, D D , Edinburgh.

Depute Clerk, Rev. J. A. McClymont, D.D., Edinburgh (Moderator Elect, 1921.) Procurator, Hon. Wm. Watson. K C Agent, A L. Menzies, W S., 54 Castle St., Edinburgh. Parlidmentary Solicitor, A. H. Spens, London.

### OTHER PRESBYTERIAN CHURCHES.

PRESBYTERIANISM HAS SEVERAL SUBDIVISIONS. (x) The United Free Church of Scotland was formed by the Union on October 31st, 1900, of the Free Church of Scotland and the United Presby-terian Church The United Church, by rear-rangement of the Synods and Presbytenes, has 28 Synods and 64 Presbyteries. The Supreme Court is the General Assembly, which meets every year at the same time as that of the Established Church. In the year ending 3r Dec., 1919, there were 1,489 congregations and 45 preaching stations. The total membership was 538,084, and there were 2,050 Sunday Schools, with 201014 scholars and 21,647 teachers In 15 Foreign Mission Fields there are 370 European Vission Agents and 5,017 native pastors, evangelists, and teachers, including in both cases those of the Women's Foreign Mission The income of the Church at the close of last financial year amounted to £x,233,322 — Moderator (1921), Rev. A. P Longforgan. 338 St. Vincent Street, Glasgow.
(a) The Calvinistic Methodist (Presbyterum)
Church of Wales (see p 292.)

(3) The Presbyterian Church in Ireland. -According to the Census of zgzz, the members of the various Presbyterian churches in Ireland were 9,876. The largest of these, under the superintendence of the General Assembly, consists of po presbyteries, 6a6 ministers, 56x congregations,

with 104,778 communicants, 90,43x families, 7,163 Sabbath-school teachers, and 92,994 scholars. During the year x919-1920 this branch contributed by congregational effort £265,94x for religious. charitable, and missionary purposes The total income for the year for all purposes was £347,985 It possesses two Colleges, with power to confer Theological Degrees, comprising a staff of 13 professors and a lecturers, and has 35 ministerial with 3 medical missionaries in foreign parts -Moderator, Rev. H. P. Glenn, B A., Bray General Secretary, Rev. W. J. Lowe, D.D., Church House,

(4) The Presbyterian Church of England has 13 presh teries, 352 congregations, 6 preaching stations, and 85,551 members. It has a Theological College (Westminster College, Cambridge), and supports 89 missionaries abroad, including 40 women. In 1918 the amount raised for all purposes last financial year amounted to £1,233,322 — was £304,941. Moderator, Rev. T. Barclay, B.D. Moderator (1921), Rev. A. P. Lougforgan, —Church Offices, 7 E. India Avenue, E.C. 3. —Offices, 121 George Street, Edinburgh; and Financial Sec. Percy Graham. Publications Office, 21 Warwick Lane, Paternoster Row, E.C. 4

(5) The less numerous divisions are: The Free Church of Scotland, consisting of those members who did not unite with the U.P. Church; the Reformed Presbyterian Synod, the Eastern Reformed Synod, the United Original Sec-ders, the Secession Presbytery in Ireland, and the Synod of the Church of Scotland in England.

## The Methodist Churches.

UNDER the general designation of METHODISTS are included all those religious bodies which owe their existence, directly or indirectly, to the efforts of the Revds. John and Charles Wesley. The most numerous and influential of them are—

WESLEYAN METHODISTS

z Wesleyan Methodists, the original body founded in 1739 by these two brothers. The first Conference, consisting of six clergymen and four laymen, was held in 1744. Since then the growth of Methodism has been great, its present adherents being given as 32,000,000 This figure, however, is probably an over-estimate, and is therefore open to correction. The latest statistics are. Ministers, 55,580: local preachers, 98,884, members and probationers, 10,184,373, Sunday schools, 94,705, officers and teachers, 954,298, scholars, 9,025, 106; churches and other preaching places, 100,607. The conference is now composed in its Representative Session of 300 ministers and 300 laymen, with a ministerial president and secretary at its head, elected year by year The Wesleyans are governed primarily by the Conference, secondarily by the Synods, which are semi-annual meetings of the ministers and selected laymen in each district, over which a chairman is appointed by the Conference, and thirdly by quarterly meetings of the ministers and lay officers of each circuit The authority of both these last meetings is subordinate to the Conference, which has the supreme legislative and judicial power in Methodism. The Wesleyan Conference will be held at Middlesbrough in ross.

—Pres., Rev J. T Wardle Stafford, D.D., D.O.L.;

Sec., Rev. John E Wakerley.

THE PRIMITIVE METHODISTS.

2. The Primitive Methodists, who sprang up in Staffordshire, in z8zo, under the leadership of flugh Bourne and William Clowes. Owing to the excesses attending certain outdoor services called "camp meetings," the Wesleyan Conference prohibited the continuance of the practice. Bourne and Clowes refused to comply with this decision, and were in consequence expelled. They and then sympathisers banded together in a new body, with enlarged powers for the laity. Next to the Wesleyans they are the most numerous and the most democratic of all the denominations which have ansen out of the Methodist movement.—President, Rev. M. P. Davison

THE UNITED METHODIST CHURCH.

3. The United Methodist Church was formed
by the Union in 1907 of three denominations of
Methodists, which hitherto had been separate

"There was the state of the state o

from and independent of each other. were:—

The Methodist New Connexion, which owed its origin in 1797 to the Rev Alexander Kilham, one of the early itinerating Wesleyau preachers. He demanded that the members of the societies, and not the Conference, should be constituted the source of all power in Methodism; and that the

Conference should consist of lay as well as ministerial members, all of whom should be elected by the members of the various societies as their delegates. He was expelled by the Conference, and at once founded a new community.

The Bible Christians, founded in 1815 by William O'Bryan, a Wesleyan lay preacher in Cornwall. They existed mainly in the West of

England.

The United Methodist Free Churches, which was itself an amalgamation of three different secessions—the Protestant Methodists, formed in 1888, the Wesleyan Methodist Association, which sprang out of a controversy in 1834, concerning the need for a trained ministry; and the Wesleyan Reform Association, founded in 1849, during a great agitation. A strong opposition to the leading Wesleyan officials was organised, which found expression in Conference debates, but more strongly in anonymous and bitter pamphlets, which were widely circulated. On suspicion of being the authors and circulators of these pamphlets three ministers were expelled. They found so many sympathisers that over 100,000 members seceded to found a new denomination.

An Act of Parliament was secured in 1907 to authorise the union of these three denominations into one, to be called the United Methodist Church, and to provide for the government of the Church by a Conference consisting of an equal number of ministers and laymen, elected by districts The act of union took place in London on September 17, 1907, when the first united Conference was held. About 700 delegates were present. A deed was adopted and signed declaring the terms of union, defining the constitution and doctrinal tenets, and containing provisions for government and discipline.—President, Rev. W. S. Welch; Secretary, Henry Smith.

#### INDEPENDENT METHODISTS.

4. Independent Methodists —This body is Congregational in its organisation, with an unpaid Ministry. Its first Conference was held in 1805 —President, W. A. Hindley.

#### WESLEYAN REFORM UNION.

5. This Union is Methodist in doctrine, Congregational in government, with, if any church desires it, a paid ministry. It is the remnant of the original reformers who seceded from Wesleyan Methodism in 1849. The adherents are mainly in the Midland counties.—Secretary, Rev. E Bromage, Sheffield.

## FINANCES.

Finances.—The Wesleyans raised in 1919-20 £257,695 to sustain their very extensive missionary operations. At the same time their Home missionary income was £21,924. The Primitive Methodusts raised £1,248 for new chapels, and the United Methodist Church £30,688 for their missions.

The number of Members is for the United Kingdom; of Chapel and Scholars, Great Britain only.	Minusters	Lay Preachrs	Members	On Pro- bation.	Chapels	Sunday Scholars.

# The Calbinistic Methodist (Presbyterian) Church of Wales.

The CALVINISTIC METHODIST OR PRESENTERIAN CHURCH OF WALES is the only Church of purely Welsh origin, and embraces a very large section of the Welsh-speaking population. Its form of government being Presbyterian, it is in federation with the Presbyterian Church of England, the United Free Church of Scotland, and the Presbyterian Church of Ireland. It is also a constituent of the Pau-Presbyterian Council or Alliance. It has foreign missions in Assam, India, and in Brittany.

In 1919 the body numbered—churches, 1.481; chapels and other buildings for Sunday-school branches, 1,774; ministers and preachers, 1,175; elders, 1,989, communicants, 187,575; on pro-bation, 1,353; Sunday-school teachers, 24,417; teachers and scholars, 191,295, adherents (mcluding communicants), 326,647.

Contributions in aid of the Ministry in 1919, £277,726 For various religious cluding the ministry), £434,732. For various religious purposes (in-

One of the features of the Welsh churches is the Sunday-school, which is attended by adults as well as children; the vernacular is the language used generally in these schools

The English branch of the Church has 365 chapels and preaching stations, with 32,343 communicants and 86,377 adherents (including communicants) Ali the rest are Welsh. The churches in Assam number 52s; commu-

nicants, 16,275; adherents (including communicants), 54,773. The adherents in Brittany are cants), 54,773. The adherents in Brittshy are few. The daughter churches in America

number 200 and in Australia 3

Moderator (South Wales) Synod, Rev. B. J.
Alees, M.A., Aberystwyth; (North Wales),
Rev. John Owen, M.A., Carnarvon.

Moderator of General Assembly, Rev. John

Morgan Jones, LLD, Cardiff Secretaries, Revs Griffith Parry Williams, M.A., Mold, and J. Henry Williams, Pottmadoc

Statistical Secretaries, Revs John Jones, Bryny. rodyn, and D. E. Thomas, Llanstephan.

## The Endependents and the Baptists.

The Independents, or Congregationalists. are the most ancient community of Dissenters. In 1831 the majority of their churchas were formed into the Congregational Union of England and Wales, incorporated in 1903, and in 1920 nine districts were formed, each under a Moderator. There are 5x county and other Associations in England and Wales, with 4,70x churches and preaching stations containing 1,727,442 sittings, the number of ministers in the British Isles is 3,062 Chairman of the Compenational Pinon of Bagland and Wales, 1930-31, Rev. A E Garvie, D.D.; 1931-32, Rev. A. J. Viner. Secretary, Rev. Richard J. Wells. Cheef Cleek, C. Stancliff Office and Publication Department, 16, Memorial Hall, Farringdon Street, E.C. 4
The Countess of Huntingdon's Connection, with

40 chapels and mission stations, is governed by nine trustees assisted by an annual conference of ministers and delegates Secretary, E Dolby

Shelton Offices, 41, Holborn Hall, Gray's Inn Road, W C x

The BAPTISTS are, in all respects but one, similar to the Independents, they have the same form of Church government, and differ but in one point of practice-viz., the Baptism by immersion of believers only. Like the Congregationalists, they are for the most part grouped in associations of churches, and the majority of these belong to the Baptist Union, which was formed in 1813. In the British Isles there were, in 1919, 4,240 chapels and 2,212 pastors. The members numbered 495,540, Sunday-school teachers 54,243, and Sunday scholars 502,764. In the U.S. the "members" alone number 7,044,092. President of the Baptist Union, 1900-21. Rev. D. J. Hiley. Secretary, Rev. J. H. Shakespeare, D. D. Office, Baptist Church House, Southampton Row, London, W.C. z.

## Minor Keligious Denominations.

MINOR RELIGIOUS DENOMINATIONS - The chief: are the Unitarians, with about 350 ministers, 345 chapels and other places of worship HQ., Essex Hall, Essex Street, W.C.z. The Society of Friends, which consists of so,os8 members and about 9,000 other adherents in Great Britain, Cape Colony and Australasia, and 2,307 in Ireland, has 272 recorded ministers, including over 100 women; their places of worship, in 1918, numbered 408. Central Offices for Great Britain, 136 Bishopsgate, E.C. a. Ireland has a separate organisation, with Office, 6 Eustace Street, Dublin. The Churches of Orisis have 14,377 members and 126 churches in the British Isles, with 159 Sunday Schools, 1,729 teachers, and 16,821 scholars. The Berryana Church (Offices, 32 Fetter Lane, E.C.) has in the UK. 43 congregations and preaching stations, with 3,680 communicants. The Catholic Apactolic Church has above 80 churches; the New Church (Swedenborgian), 75 societies, with about 6,700 registered members; the Latter-Day Saints (Mormons) have & churches. The Brethren,

or Plymouth Brethren (divided into two bodies, "Open" and "Exclusive") number about 80,000, of whom five-eighths belong to the "Open" hody. The Reformed Episoopal Church: Presiding Bushop in England, E. Rev. P. Kenophon Eldridge, D.D., St. Jude's Ch., Balham, S. W. The Old Roman Catholic Church: Archbushop in Great Britain, Most Rev. Bernard Mary Williams, The Edge, Stroud, Glos. Among the inhabitants of the Linted Kingdom are about zo con Jawa, mainly United Kingdom are about 300,000 Jews, mainly in London and other large towns, who possess soo synagogues, with about soo ministers and readers. Chief Rabbi, Very Rev. Dr. J. H. Hertz. Chef Rabit's Office, Mulberry Street, Commercial Road, E.z. The Jews support their own poor. Their number throughout the world is computed at fourteen millions. The Greeks have churches in London, Manchester, Liverpool, and Cardiff. The Armenians have churches in London and Manchester, the computed of Manchester; the French, Dutch, Swedes, and Swiss in London, Norwich, and Canterbury; and there is a mosque for Moslems.

In England and Wales there are 4 Archiepiscopal and 13 Episcopal Sees; in Scotland 2 Archiepiscopal and 4 Episcopal Sees; in Ireland 4 Archiepiscopal and 24 Episcopal Sees. In the British Empire there are 38 Archiepiscopal and 212 Episcopal Sees, with 34 Vicariates and 9 Prefectures Apostolic, as follows:—

#### ORGANISATION OF TEACHING.

On January z, z907, University College was transferred to the University, of which it now forms an integral part in the faculties of Arts, Laws, Medicine, Science, Engineering, and Economics. On January 1, 1910, King's College was, in respect of all its Departments except that of Theology, transferred to the University, of which it now forms an integral part, but is divided into two separate institutions, viz (a) "King's College" (in the Facultics of Arts, Laws, Medicine, Science, Engineering, and Economics) and (b) "King's College for Women '(in the Faculties of Arts and Science). The Theological Department of the College remains a "School of the University" in the Faculty of Theology. Other Institutions maintained by the University are the Brown Animal Sanatory Institution in Wandsworth Road, the Physiological Laboratory in the University buildings at South Kensington, Goldsmiths' College at New Cross, the Francis Galton Laboratory for National Eugenics at University College, and the Ratan Tata Department of Social Science and Administration at the London School of Economics and Political Science.

TEACHING STAFF.

The numbers of the "Appointed" and "Recognised" Teachers in the several Faculties are as tollows .-

Theology o and zs; Arts, 59 and z68. Laws, 4 and 9; Music, z and zz; Medicine, z9 and zso; Science, 53 and zz8, Engineering, zz and z8, Economics, 19 and 18.

DEANS OF THE FACULTIES, 1920-22. Theology, Rev. Prof. S. W. Green, M.A. Arts, Prof. Sir Sidney Lee, LL.D., Litt.D., F.B.A. Laws, H. J. H. Mackay, M.A., LL.B. Music, T. F. Dunhill, A.R.C.M. Medicine, H. J. Waring, C.E.E., M.S., M.B., F.R.C.S. Science, A. N. Whitehead, Sc.D., M.A., F.R.S. Engineering, Prof. E. G. Coker, D.Sc., F.R.S. Economics, Mrs. Knowles, Litt.D.

UNIVERSITY COLLEGE, Gower Street, W.C. 2. Chairman of Committee, Lord Reay, K.T., 6,C.S.I. Provost, Sir Gregory Forter.

TRAINING SHIP Indefatigable, New Ferry, Bir-For boys between 13 and 141/2 years kenhead of age and of good character only." Supt , Commander H. Butterworth, R N

TRAINING SHIP Mercury, Hamble, Southampton, Hants For boys of good character only, intended for entry to Special Branches of the Military Branch R. N. or for Cadet apprenticeship in the Mercantile Marine -Hon. Director, C B Fry, Commr R.N.R

OCKAN TRAINING SHIPS.—This scheme for training officers for the Merchant Service and R N R is now carried on at the Nautical College, Pangbourne, and in the Cadet Traming Ship St George, making three foreign sailing cruises from Plymouth in the year.

## SCHOOL OF ORIENTAL STUDIES

(Incorporated),

London Institution, Finsbury Circus, E C. Chairman of Governing Body, Sir John P. Hewett, G C S.I., K.B E., C I.E Director, Prof Sir E. Denison Ross, C I E., Ph.D. Secretary, M188 C. L. Clegg.

#### TECHNICAL EDUCATION.

In addition to the Institutions enumerated below there are Faculties of Engineering at the I miversities of Birmingham, Bristol, Cambridge, Ducham, Leeds, Inverpool, London, Manchester, and Sheffield, Wales; St Andrews, Glasgow, and Edinburgh; Publin, National University of Ireland, and the Queen's University of Belfast.

I -UNDER LONDON COUNTY COUNCIL The principal technical institutes maintained or aided by the London County Council are the following .-

Institutes entirely maintained by the L C C

BEAUFOY INSTITUTE, Prince's Road Vauxhall Street, S E II -Principal Dr A Ritchie-Scott. CAMBERWELL SCHOOL OF ARTS AND CRAFTS, Peckham Rd., S E 5 — Principal, S. Thotogood. CENTRAL SCHOOL OF ARTS AND CRAFTS, Southampton Row, W.C.—Principal, Fred V. Burridge.

CLAPHAM SCHOOL OF ART, Edgely Road, High St., Clapham, S.W. 4 .- Principal, T. McKeggie,

A.R C.A (hon)
HACKNEY INSTITUTE.—Principal, Percy R. Kirk,

M.A., A.M.I.C.E.
(a) Hackney Institute, Dalston Lane, E. 8. (b) Hackney Institute, Sir John Cass's branch, Cassland Road, E. g.

HAMMERSMITH SCHOOL OF ARTS AND CRAFTS, Lime Grove, Shepherd's Bush, W. 12.—Princi-pal, John Williams.

NORWOOD TECHNICAL INSTITUTE, Knight's Hill, West Norwood, S.E.-Principal, W. Huntington, B.Sc

Paddington Technical Institute, Saltram Crescent, W.—Principal, A. G. Cooke, M.A. PUTNEY SCHOOL OF ART, Oxford Road, Putney .-Principal, J. Bowyer.

SCHOOL OF BUILDING, Ferndale Road, Brixton, SW 4.—Principal, H W. Richards.

SCHOOL OF ENGINEERING AND NAVIGATION, High Street, Poplar, E.-Principal, H. A. Garratt, A M.I.C.E. Sec., D. H. Flynn.

SCHOOL OF PHOTO-ENGRAVING AND LITTIC GRAPHY, 6 Bolt Court, Fleet Street, E.C. 4-LITHO-

Principal, A. J. Bull, M.Sc. TECHNICAL INSTITUTE, Pitfield SHOREDITCH Street, Hoxton, N — Principal, Shadrach Hicks. Frade School for Girls (L.C.C. Hammersmith),

Lime Grove, Shepherd's Bush, W.-Lady Superintendent, Miss M. A. J. Boon.

TRADE SCHOOL FOR GIRLS, Queen Square, Bloomsbury, W.C.—Headmistress, Miss F. E. I. Smythe.

WESTMINSTER TECHNICAL INSTITUTE, Vincent Square, S W., with which is incorporated the WESTMINSTER SCHOOL OF ART — Principal, J Stuart Ker, B Sc , Head (Sch of Art), Walter Bayes.

#### Polytechnics aided by the L.C.C

BATTERSKA POLYTECHNIC, Buttersea Park Road, S W -Principal, Robt. H. Pickard, D Sc., FRS.

BIRKBECK COLLEGE, Breams Buildings, Chancery Lane .- Principal, George Senter, D Sc. BOROUGH POLYTECHNIC, Borough Road, S. E. z .-Principal, C. T. Millis, M.I Mech. E.

CITY OF LONDON COLLEGE, White Street, Moorfields. - Principal, Sidney Humphries, B A.,

NORTHAMPTON POLYTECHNIC, 280 St. John Street, E.C. x.—Principal, R M Walmsley, p Sc. NORTHERN POLYTECHNIC, Holloway Rd., N. 7 .-

Principal, R S Clay, D.Sc.

REGENT STREET POLITECHNIC, 300 Regent Street, W. I.—Director of Education, Major Robert Mitchell, C B E. SIR JOHN CASS TECHNICAL INSTITUTE, Aldgate.

-Principal, C A Keane, D Sc South-Western Polytechnic, Manresa Road,

Chelsea, S W — Principal, S Skinner, M A WOOLWICH POLYTECHNIC, William Street, Woolwich, S E. 18 -Principal, A. F. Hogg, M.A.

**Technical Institutes,** dc , arded by the L C C.

ALBANY INSTITUTE DOMESTIC ECONOMY SCHOOL FOR GIRLS, Albury Street, Deptford .- Head Mistress, Mrs. Landels

BERMONDSEY SETTLEMENT, Farncombe Street, Jamaica Road, S E .- Warden, Rev. J. Scott Lidgett, D D.

CHURCH INSTITUTE, Wiseton Rd , Upper Tooting. -Hon. Secretary, C H Baker.

—Hon. Secretary, C. H. Baker. COLLEGE FOR WORKING WOMEN, Fitzroy Street, W. z.—Hon. Secretary, Mrs. H. F. Plant. DEVAS INSTITUTE, New Road, Battersea, S. W.— Secretary, W. K. Holmes. GOLDSMITHS' COLLEGE, New Cross, S. E. z4—War-

den, T. Raymont, M.A.

HEROLD'S INSTITUTE, Drummond Road, Bermondsey (Branch of the Borough Polytechnic).— Principal, C. T. Millis, M I Mech. R.

LEATHERSELLERS' COMPANY'S TECHNICAL COL-LEGE, 176 Tower Bridge Road, S.E.—Principal, Dr. J. Gordon Parker, F.LC. MORLEY COLLEGE, Waterloo Road, S.E .- Vice-Principal, Miss C. I. Brennand.

NEWCOMEN'S FOUNDATION TRADE SCHOOL FOR DOMESTIC SERVICE, Newcomen Street, Borough, S.E. 1 .- Lady Principal, Miss R. A. Roberts.

ROYAL SCHOOL OF ART NEEDLEWORK, Exhibition

Road, S.W.—Principal, Miss E. Bradshaw.
SAILORS' HOME, Dock Street, E. (School of Nautical Cookery).—Secretary, Payr.-Lt.-Comm. A. E. Loder, R N.R.

ST. BRIDE FOUNDATION INSTITUTE, Bride Lane. Fleet Street, E.C. (for Printing Trades) — Principal, J. R. Riddell. SCHOOL OF WOOD-CARVING, 39 Thurloc Place,

S.W. 7.—Secretary, J. Bailey WANDSWORTH TECHNICAL INSTITUTE, High Street, Wandsworth, S. W 18 .- Hon. Principal,

A. R. Gridley, M A WORKING MEN'S COLLEGE, Crowndale Road, N.W. z.—Superintendent, A. A. Aldworth, M.A.

Schools of Art aided by the L C C BLACKHEATH, LEE, LEWISHAM AND GREENWICH, Tempy premises, Lee Terrace, Blackheath -Principal, J. Howard Hale.

St. MARTIN'S, 107 Charing Cross Road, W.C.— Headmaster, J. E. Allen.

In addition to the above schools there are Art Schools or Classes attached to all the Polytechnics, except the Northern Polytechnic Schools of Art are also conducted by the City and Guilds of London Institute at Finsbury Technical College and at the South London Technical Art School, zss-zs4 Kennington Park Road (see below).

#### II.—OTHER LONDON INSTITUTIONS Imperial College of Science and Technology, South Kensington, S W 7. Visitor H M. THE KING.

Chauman of Governing Body, The Marquess of

Crewe, K.G Chairman of Executive Committee, Right Hon. Sir Arthui Acland.

Chairman of Delegacy, Walter T Prideaux.

An Institution for the most advanced training

and research in Science, especially in its appli-cation to industry. The Departments and Professors are

Royal College of Science.

Aeronautics: Sir Richard Glazebiook, K.C.B, F.R.S. (Aviation); Sir Napier Shaw, F.R S
